subject MERV Efficiency

Minimum Efficiency Reporting Value (MERV) 13 Air Filtration

MERV 13 filters have a removal efficiency of 90 percent for particles ranging from 1 to 3 microns and less than 75 percent for particles ranging from 0.3 to 1 microns.[1,2] The BAAQMD's Planning Healthy Places guidance indicates that MERV 13 air filtration devices installed on an HVAC air intake system can remove 80-90 percent of indoor particulate matter (greater than 0.3 microns in diameter).[3] MERV 13 filters are required to be installed in new homes built on the project site per the 2019 California Energy Code.

The effectiveness of MERV 13 filters was determined based on a literature review of studies testing and modeling the overall effectiveness of MERV 13 filters installed in homes and commercial buildings in removing particulates. Fisk et. al. (2002) found that MERV 13 filters reduced fine particulates by 80% indoors.[4] In a 2016 study funded by CARB, Brett Singer of Lawrence Berkeley National Laboratory found that MERV 13 filtration on a supply ventilation system reduced $PM_{2.5}$ by 63-67%.[5] A recent BAAQMD study from 2018 found homes that installed forced air furnaces with MERV 13 filters reduced indoor levels of $PM_{2.5}$ by 90% from outdoor

levels.[6] A study by Azimi et. al. from 2014 analyzed the effectiveness of MERV filters on HVAC systems and found a $PM_{2.5}$ removal efficiency of 66% for MERV 12 and 71% for MERV 14.[7] Brown et. al. (2014) modeled the effectiveness of MERV 13 in homes and calculated a removal efficiency of 65% for outdoor $PM_{2.5}$ when accounting for natural ventilation and leakage through and around windows.[8]

Further analyzing the ability of new homes to remove outdoor $PM_{2.5}$, Zhao et. al. (2015) modeled six vintages of single family homes and found that new homes had an infiltration factor of less than 0.05 for all filter types installed, ranging from MERV 5 to MERV 16; in other words, indoor concentrations of $PM_{2.5}$ were 95% lower than outdoor concentrations for all new homes with at least a MERV 5 filter installed.[9] A second study by Azimi et. al. from 2016 found that only 3 percent of outdoor $PM_{2.5}$ infiltrated into new homes with MERV 5 filters installed.[10] For office buildings, Kabrein et. al. (2017) measured indoor $PM_{2.5}$ concentrations in office buildings equipped with MERV 13 filters and found that during occupied periods, 86% of PM10 was removed and 86% of $PM_{2.5}$ was removed.[11] These studies accounted for natural ventilation and leakage through and around windows and doors.

Studies have also been conducted for schools retrofitted with MERV 13 and MERV 16 filtration systems, in order to determine the overall effectiveness of the system's ability to remove outdoor particulates while accounting for open windows, doors, and comings-and-goings of students and staff. According to pilot studies from the South Coast Air Quality Management District in 2009, MERV 16 filters installed in three schools removed reduced indoor levels of outdoor-generated black carbon and $PM_{2.5}$ by an average of 87 to 96 percent.[12] Use of a MERV 16 panel filter alone in the HVAC system achieved average particle reductions of nearly 90%. Although these studies evaluated MERV 16 specifically, the results can be used to estimate the equivalent effectiveness of MERV 13 filters. MERV 16 filters have a removal efficiency of 95 percent for particles ranging from 0.3 to 10 microns; using the ratio of particulate removal efficiencies for 0.3 to 1 micron particles between MERV 13 and MERV 16 filters, (75 percent for MERV 13 and 95 percent for MERV 16), a $PM_{2.5}$ removal efficiency of 87 percent for MERV 16 (on the low end of the range) would correspond to a 69 percent $PM_{2.5}$ removal efficiency for MERV 13.

The National Human Activity Pattern Survey, sponsored by EPA, found that Americans spend approximately 90% of their time indoors: 69% of their time is spent in their home, 11% is spent at other indoor locations such as

a school, 7.6% is spent outdoors, 5.5% is spent in a vehicle, 5.4% is spent at an office or factory, and 1.8% is spent in a restaurant.[13] As discussed above, multiple studies (Zhao et. al., 2015; Azimi et. al., 2016) found that outdoor $PM_{2.5}$ infiltrationthrough the building envelope is already very low, even without MERV 13 filters installed; only 3-5% of outdoor $PM_{2.5}$ was present indoors in new homes. Therefore, it can be reasonably assumed that new on-site residential receptors are likely to be inside the vast majority of the time, and that when they are at home, the building envelope combined with MERV 13 filters would substantially reduce their exposure to outdoor DPM and $PM_{2.5}$ concentrations caused by the proposed project (such as off-road construction and on-road vehicle traffic).

Based on this evidence, new on-site residential and childcare buildings at the project site with MERV 13 filters installed would significantly reduce outdoor DPM and $PM_{2.5}$ concentrations for indoor occupants. Based on a thorough literature review, as discussed above, it is expected that these concentrations would be reduced by a minimum of 65-70%, and a maximum of 85-95%. Consequently, it was conservatively assumed that MERV 13 filters would reduce the total exposure of new on-site receptors to DPM and $PM_{2.5}$ concentrations by 60 percent. This is a conservative assumption because it represents the low range of particulate removal efficiency evidenced by recent studies, and doesn't account for the extremely low particulate matter infiltration rates through the building envelope of new construction.
