## Executive Summary

---

This report presents the results of the traffic impact analysis conducted for the proposed America Center Phase III project in North San Jose. The America Center III Project proposes modifications to the allowed amount of development under the existing Planned Development Zoning (PDC 03-24) within the Commercial Office/Research and Development (R&D) area of the America Center Development. The proposed project would increase the total allowed commercial office, R&D, and amenity space on the site by 190,000 square feet, from 900,000 to 1,090,000 square feet.

The project also includes a specific development; construction of a building with up to 216,350 sf of office space and the expansion of the approved, and currently under construction, 830 space parking garage to include a total of 1,870 parking spaces as well as 6,000 sf of amenity space. Additional parking for the project will be provided by 1,740 surface parking spaces. Access to the site is provided from America Center Drive, which is a private street and extends from the northern terminus of Great America Parkway into the America Center.

The project site is part of the approved America Center Project site for which a traffic study was completed in 1999. The America Center project included 900,000 square feet (s.f.) of office space, a 175-room hotel, and 25,000 s.f. of commercial/retail space. A total of 420,094 sf of office space and the 175-room hotel has been constructed on the site. Two more buildings containing 431,668 sf of office space, 16,000 sf of amenity space, and an 830-space parking garage are currently under construction. The 25,000 s.f. of commercial/retail space was planned adjacent to the Guadalupe River, just west of the Union Pacific Railroad line which is now a separate zoning district approved as part of PDC15-016 in March 2016. Once the four office buildings are completed, there is 32,238 s.f. of remaining office/R&D space entitlement provided on the project site that will be used by the proposed project.

## Scope of Study

The purpose of the study is to identify the potential traffic impacts related to the proposed project. The potential impacts related to the proposed development were evaluated following the standards and methodologies set forth by the Cities of San Jose and Santa Clara and the Santa Clara Valley Transportation Authority (VTA). The VTA administers the County Congestion Management Program (CMP).

The study includes an analysis of AM and PM peak-hour traffic conditions for 16 signalized intersections and two unsignalized intersections within the Cities of San Jose and Santa Clara as well as 12 directional freeway segments. The study intersections were selected based upon the estimated number of project trips through the intersection (10 or more trips per lane per hour). Any intersections outside of the study area to which the project would not add 10 or more trips per lane per hour, were not studied because the addition of project traffic would not be a sufficient amount to result in the degradation of intersection levels of service. The study also includes an operations analysis, based on vehicle-storage requirements at select intersections and site access analysis, which includes level of service analysis and vehicle-storage requirements at the proposed project entrances.

Traffic conditions at all of the study intersections were analyzed for the weekday AM and PM peak hours. The weekday AM peak hour of traffic is generally between 7:00 and 9:00 AM and the weekday PM peak hour is typically between 4:00 and 6:00 PM. It is during these periods that the most congested traffic conditions occur on a typical weekday.

## Project Trip Generation

Through empirical research, data have been collected that correlate to common land uses their propensity for producing traffic. Thus, for the most common land uses there are standard trip generation rates that can be applied to help predict the future traffic increases that would result from a new development. Project trip estimates are based on trip generation rates obtained from the Institute of Transportation Engineers' (ITE's) *Trip Generation*, Ninth Edition, 2012.

The proposed project consists of the construction of up to 216,350 sf of office uses. The evaluation of existing plus project conditions requires the analysis of the entire proposed development on the project site against existing traffic conditions. Therefore, trip credit due to the replacement of the approved 32,238 sf of R&D space is not applied and the entire proposed 216,350 sf of office space proposed under the PD rezoning is evaluated under existing plus project conditions. For the evaluation of background plus project conditions, the remaining 32,238 s.f. of entitled R & D space on the project site is considered. The 6,000 sf of proposed amenity space within the parking garage is not counted toward project trip generation as it would serve the proposed use and is not anticipated to generate additional vehicle trips.

### **Existing Plus Project**

Based on the ITE trip generation rates, it is estimated that the proposed 216,350 sf of office uses would generate 2,386 daily trips, with 338 trips (297 inbound and 41 outbound) occurring during the AM peak hour and 322 trips (55 inbound and 267 outbound) occurring during the PM peak hour.

### **Background Plus Project**

Based on the ITE trip generation rates, and applying credit for the entitled 32,238 sf of R&D space, it is estimated that the proposed office space on the project site would generate a net additional 2,141 daily trips, with 299 trips (266 inbound and 33 outbound) occurring during the AM peak hour and 288 trips (52 inbound and 236 outbound) occurring during the PM peak hour when compared to the previously approved project.

## Project Intersection Level of Service Analysis

Table ES-1 summarizes the results of the intersection level of service analysis under existing plus project and background plus project conditions.

The results of the level of service analysis show that, measured against the applicable municipal and CMP standards, all of the study intersections would operate at an acceptable LOS D or better under existing plus project conditions during both the AM and PM peak hours of traffic.

The results show that one intersection located within the City of San Jose would be significantly impacted by the project under background plus project conditions, according to applicable municipal and CMP impact criteria. The proposed improvements to mitigate the project impacts are described below.

### **(2) Lafayette Street and Gold Street Connector (City of San Jose)**

**Mitigation Measure.** This intersection's level of service could be improved with the addition of a second northbound left-turn lane. The improvement would reduce the average delay for vehicular traffic to an acceptable LOS D during the AM peak hour. The improvement will require widening of the Gold Street

Connector and shifting of travel lanes to the south by approximately 12 feet to accommodate a second receiving lane for the second northbound left-turn lane. The roadway widening also will require the relocation of the park trail, south of the Gold Street Connector. The addition of a second northbound left-turn lane at the intersection also was identified as a mitigation measure for the approved City Place development in the City of Santa Clara. Traffic associated with the City Place development is included within background conditions of this study. However, the City of San Jose has no authority of development within other jurisdictions or their development schedules. Therefore, the project will be required to construct the improvements.

## Cumulative Intersection Level of Service Analysis

Table ES-1 summarizes the results of the intersection level of service analysis under cumulative conditions. The results show that, two intersections in the City of San Jose would be significantly impacted by the project traffic based on applicable municipal cumulative significance criteria.

Described below are the possible intersection improvements for the cumulatively significant intersection impacts to which the project's contribution is deemed considerable.

### ***(2) Lafayette Street and Gold Street Connector (City of San Jose)***

**Mitigation Measure.** This intersection's level of service could be improved with the addition of a second northbound left-turn lane. The improvement would reduce the average delay for vehicular traffic to an acceptable LOS D during the AM peak hour. The improvement will require widening of the Gold Street Connector and shifting of travel lanes to the south by approximately 12 feet to accommodate a second receiving lane for the second northbound left-turn lane. The roadway widening also will require the relocation of the park trail, south of the Gold Street Connector. The addition of a second northbound left-turn lane at the intersection also was identified as a mitigation measure for the approved City Place development in the City of Santa Clara. Traffic associated with the City Place development is included within background conditions of this study. However, the City of San Jose has no authority of development within other jurisdictions or their development schedules. Therefore, the project will be required to construct the improvements which also were identified to mitigate its project-level impacts.

### ***(3) Great America Parkway and SR 237 (North) (City of San Jose)***

**Mitigation Measure.** This intersection's level of service could be improved by adding a third left-turn lane and second right-turn lane to the intersections westbound approach (SR 237 off-ramp). This improvement would reduce the average delay for vehicular traffic to an acceptable LOS D during the AM peak hour. The improvement was an identified mitigation measure for the approved City Place development in the City of Santa Clara. Traffic associated with the City Place development is included within background conditions of this study.

## Freeway Segment Analysis

The results of the freeway level of service analysis are summarized in Table ES 2. The results of the freeway segment analysis show that, based on the CMP freeway segment criteria, the project would have a significant impact on mixed-flow lanes on four directional freeway segments and HOV lanes on one directional freeway segment during at least one peak hour.

Full mitigation of significant project impacts on freeway segments would require roadway widening to construct additional through lanes, thereby increasing freeway capacity. Since it is not feasible for an individual development project to bear responsibility for implementing such extensive transportation system improvements due to constraints in acquisition and cost of right-of-way, and no comprehensive project to add through lanes has been developed by Caltrans or VTA for individual projects to contribute

to, the significant impacts on the directional freeway segments identified above must be considered significant and unavoidable.

## Other Transportation Issues

### *Intersection Operations Analysis*

#### Great America Parkway and Gold Street Connector

The queuing analysis indicates that the maximum vehicle queues for the southbound left-turn pocket at the Great America Parkway and Gold Street Connector intersection would exceed the existing vehicle storage capacity under existing plus project, background and background plus project conditions.

The southbound left-turn lane currently provides approximately 100 feet of vehicle storage, which can accommodate approximately four vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the southbound left-turn movement is projected to be approximately seven vehicles during the PM peak hour under background conditions. The addition of project traffic would lengthen the projected vehicle queue by no more than two vehicles during the PM peak hour. The southbound left-turn pocket already extends to the upstream intersection (America Center Drive and America Center Court). Thus, it is not possible to extend the left-turn pocket to meet the projected queue.

#### Lafayette Street and Gold Street Connector

The queuing analysis indicates that the maximum vehicle queues for the northbound left-turn pocket at the Lafayette Street and Gold Street Connector intersection would exceed the existing vehicle storage capacity under background and background plus project conditions.

The northbound left-turn lane currently provides approximately 350 feet of vehicle storage, which can accommodate approximately 14 vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the northbound left-turn movement is projected to be approximately 17 vehicles during the PM peak hour under background conditions. The addition of project traffic would lengthen the projected vehicle queue by no more than one vehicle during the PM peak hour. The left-turn pocket already extends to the upstream intersection (Lafayette Street and Great America Way). Thus, it is not possible to extend the left-turn pocket to meet the projected queue. However, a second northbound left-turn lane as proposed at the intersection to mitigate level of service impacts would provide adequate storage to serve the projected queue.

#### Great America Parkway and SR 237 (South)

##### **Southbound Left-Turn**

The queuing analysis indicates that the maximum vehicle queues for the southbound left-turn pocket at the Great America Parkway and SR 237 (South) intersection would exceed the existing vehicle storage capacity under background plus project conditions during the PM peak hour.

The southbound left-turn lane currently provides approximately 200 feet of vehicle storage, which can accommodate approximately eight vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the southbound left-turn movement is projected to be approximately nine vehicles during the PM peak hour under background plus project conditions. The southbound left-turn pocket already extends to the upstream intersection, Great America Parkway and SR 237 (North). Thus, it is not possible to extend the left-turn pocket to meet the projected queue. However, a maximum left-turn pocket storage inadequacy of only one vehicle is a worst-case traffic condition and is not likely to result in any operational problems at this intersection.

### **Eastbound Left-Turn**

The queuing analysis indicates that the maximum vehicle queues for the eastbound left-turn pocket at the Great America Parkway and SR 237 (South) intersection would exceed the existing vehicle storage capacity under background and background plus project conditions.

The eastbound left-turn lane currently provides approximately 300 feet of vehicle storage, which can accommodate approximately 12 vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the eastbound left-turn movement is projected to be approximately 21 vehicles during the AM peak hour under background conditions. The addition of project traffic would lengthen the projected vehicle queue by no more than one vehicle during the AM peak hour. The eastbound left-turn pocket could potentially be extended to provide an additional 225 feet of storage.

### ***Signal Warrant Analysis***

#### **Lafayette Street and Great America Way (City of Santa Clara)**

Peak-hour traffic signal warrant checks indicate that the traffic volumes at the Lafayette Street and Great America Way intersection during the PM peak hour are projected to meet thresholds that warrant signalization under background and background with project conditions.

Traffic volumes indicate that the signalization of the Lafayette Street and Great America Way intersection is not necessary until the construction of other approved development in the project area, which includes the City Place development, is completed. The installation of a signal at the intersection was also identified to be warranted with the City Place development. The proposed project will result in a total of 58 PM peak hour trips through the intersection. Because signalization of an intersection is dependent upon many factors and may be required regardless of the proposed project, the City of Santa Clara will decide when and if a signal should be installed and provide funding for its construction. Therefore, the proposed project would not result in a significant impact at the Lafayette Street and Great America Way intersection.

### ***Freeway Ramp Analysis***

An analysis of metered freeway ramps providing access to the project site was performed to identify the effect of the addition of project traffic on the queues at metered study freeway on-ramps. It should be noted that the evaluation of freeway ramps is not required based on the City's transportation impact analysis guidelines. Nor are there adopted methodologies and impact criteria for the analysis of freeway ramps.

It is projected that the project will result in the addition of peak hour trips to two freeway interchanges: (1) US 101 at Great America Parkway/Bowers Avenue, (2) and SR 237 at Great America Parkway. The metered freeway on-ramps were evaluated during the PM peak hour of traffic only since the majority of the proposed project traffic that is projected to be added to freeway on-ramps will occur during the PM peak hour. Both the westbound and eastbound on-ramps at SR 237 interchange are metered during the PM peak hour. However, only the southbound loop on-ramp at the US 101 interchange is metered during the PM peak hour.

Based on the freeway ramp analysis, the proposed project traffic will have minimal effect on delay and queues at the southbound on-ramp at the US 101/Bowers Avenue and westbound on-ramp at the SR 237/Great America Parkway interchanges. The addition of project traffic to each of the ramps will equate to a less than 3.0% increase in volume and would extend the wait times by no more than six seconds during the PM peak hour. In addition, the addition of project traffic would result in the extension of projected queues at each ramp by no more than one vehicle.

### **SR 237 Eastbound On-Ramp from Great America Parkway**

The addition of project traffic to the SR 237 eastbound diagonal on-ramp from Great America Parkway will equate to an approximately 54% increase in the southbound left-turn volume during the PM peak hour and would extend the wait times at the ramp by approximately 34 seconds.

The maximum queue lengths measured in the field and projected under project conditions would extend beyond the available storage on the on-ramp. The SR 237 eastbound diagonal on-ramp from Great America Parkway already provides one HOV lane and two mixed-flow lanes. The ramp overcrossing of Lafayette Street, located approximately 550 feet east of Great America Boulevard, restricts the addition of storage on the ramp. Therefore, additional physical improvement for the purpose of queue storage at the ramp would consist of widening Great America Parkway and possibly the SR 237 overcrossing.

The widening of Great America Parkway and addition of a southbound left-turn lane would provide additional queue storage. However, the additional southbound lane would not provide an operational benefit to ramp operations since the ramp operations are dictated by the ramp meter rate. There will be no reduction in projected queues without an adjustment of the ramp meter rate to increase the number of vehicles being fed onto the freeway. The City has worked cooperatively with VTA and Caltrans to implement measures to minimize the effects of vehicular queues at freeway ramps, such as shutting off the ramp meters when vehicular queues extend back onto the arterials. The City will continue to monitor the effects of traffic growth in the area and its effects on freeway ramp operations and work with VTA and Caltrans to implement further measures when deemed necessary.

### ***Site Access***

The proposed Building 5 will be located at the southeast corner of the America Center office campus. Nearly all of the planned on-site roadways that will serve the campus, including the proposed Building 5, are completed. Access to the proposed Building 5 would be taken from the existing on-site roadways of America Center Drive and America Center Court. The project does not involve changes to the existing site access and circulation.

The campus, including the proposed Building 5, will be served by an 1,870 space-parking garage located along the southern and eastern boundaries of the site. The garage is currently under construction. Access to the parking garage will be provided by two driveways along America Center Court. A driveway will also be located at the north end of the garage and accessed from America Center Drive.

America Center Court intersects with America Center Drive just north of the Gold Street Connector. America Center Court is 36 feet wide between America Center Drive and the point at which it changes to a north/south alignment. The roadway narrows to a 26 feet wide travel way along its north/south alignment. The results of the peak-hour traffic signal warrant checks at the America Center Drive and America Center Court intersection indicate that the projected traffic volumes under project conditions will not meet thresholds that warrant signalization.

### ***Parking Analysis***

Per the City of San Jose Municipal Code (Chapter 20.90.060), office land uses are required to provide one space per 300 sf of building space. Based on the City's parking requirements, a total of 3,614 off-street parking spaces are required for the 1,084,112 sf of office space (867,762 sf of existing/planned plus proposed 216,350 sf) on the entire campus.<sup>1</sup> The project proposes a total of 3,610 on-site parking spaces (1,870 parking spaces within the planned parking garage and 1,740 spaces within surface parking lots). The surface parking areas should be configured to provide the additional four spaces to meet the City's parking requirements if Building 5 is proposed to utilize all the square footage that is included as part of the rezoning.

---

<sup>1</sup> The 6,000 sf of proposed amenity space is not counted toward parking requirements as it would serve the proposed use and is not anticipated to generate additional vehicle trips.

### ***Bicycle Parking***

The City's Bicycle Parking requirements require one bicycle parking space per 4,000 square feet of office floor area. The proposed project at full buildout is required to provide 271 bicycle parking spaces to meet the city standards. It is recommended that the project provide bicycle parking that exceeds the City requirements to encourage the use of non-auto modes of travel and minimize the demand for on-site parking described above.

### ***Transit Services***

The project site is not directly served by any transit services other than the ACE Shuttle that has a stop within the America Center development. The ACE Green Shuttle (823) operates on Tasman Drive and Great America Parkway between its route from the Great America ACE Station and the America Center campus. There are scheduled stops at the Convention Center and Old Ironsides LRT Stations along Tasman Drive, which also provides connections to other VTA bus lines. The nearest bus stops are located along Gold Street near its intersection with Taylor Street that is located approximately one mile from the project site and at the intersection of Tasman Drive and Old Ironsides Drive located approximately 1.5 miles from the project site. The nearest LRT station is also located at the intersection of Tasman Drive and Old Ironsides Drive.

It is assumed that only a minimal number of employees of the proposed office development would utilize existing transit services due the long walking distance and lack of pedestrian facilities linking the project site to transit facilities. In addition, the ACE shuttle provides only four scheduled runs during the morning and evening commute hours. It is recommended that the project pursue implementation of employee shuttles to provide a link between the project site and transit services (LRT station and bus stops) near the Old Ironsides and Tasman Drive intersection and Great America ACE Station. Should shuttle buses be implemented, the highest transit mode-share that could be expected for the project would be an estimated three percent, which equates to approximately 8 to 9 new transit riders during the peak hours. Assuming the existing transit service would remain unchanged, with five bus lines and the Mountain View-Alum Rock LRT line providing service near the project site, the new riders due to the proposed project can be accommodated by the current available capacity of the transit service in the study area.

### ***Bicycle and Pedestrian Facilities***

There are several bike lanes and bike paths in the vicinity of the project site. In addition, the San Jose Bike Plan 2020 and Envision 2040 General Plan identifies planned improvements to the bicycle network within the City and provides policies and goals that are intended to promote and encourage the use of multi-modal travel options and reduce the identified project impacts to the roadway system. The planned improvements to the bicycle network will provide the project site with improved connections to surrounding pedestrian/bike and transit facilities and a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies. In the immediate area of the project, a Class I off-Street trail is planned to run generally around the perimeter of the America Center Campus with connections to the Baylands Park Trail near the Lafayette Street/Gold Street Connector intersection and San Tomas Aquino Creek. An additional connection to the Bay Trail is proposed as part of the Residence Inn project at the northern termination of America Center Court.

Pedestrian facilities in the immediate project area are limited. In particular, there are no sidewalks provided along America Center Court, the east side of America Center Drive along the Building 5 frontage, and either side of America Center Drive between the Gold Street Connector and the Building 5 frontage which are all private street segments. Sidewalks are provided along both sides of America Center Drive north of the Building 5 frontage. There is an unpaved walkway provided along the west side of America Center Drive between the America Center office buildings and the Gold Street Connector.

It is unlikely that the proposed project will result in measurable increase of pedestrians given that the nearest commercial uses and transit services are located more than 1.5 miles from the project site. However, pedestrian traffic from the project site could include the recreational use of the Baylands Park

Trail by employees that runs along the north side of SR 237. Access to the trail is provided at the SR 237 and Great America westbound ramps intersection. The intersection provides controlled crosswalks across Great America Parkway on its north approach and across the SR 237 westbound on-ramp. Use of the trail and crosswalks at the SR 237 and Great America westbound ramps intersection by pedestrians originating from the proposed Building 5 will require crossing America Center Drive. Given the lack of pedestrian facilities along the east side of Great America Parkway south of the project site, it is not recommended that sidewalks be provided along the Building 5 frontage. Instead, pedestrians should be directed with wayfaring signs to the use of the parking lot drive aisles and entrances along America Center Drive located between Buildings 1-2 and 3-5.

### ***Transportation Demand Management***

The project will establish single-occupant auto trip reduction measures, via a travel demand management (TDM) program, that result in the reduction of vehicular trips to the project site and reduce the demand for on-site parking discussed above. The TDM program should encourage multimodal travel and use of the extensive transit services and pedestrian/bicycle facilities in the North San Jose area to the maximum extent possible. The applicant/property owner should manage the TDM program to ensure tenant employee participation. An effective TDM program that includes several of the measures identified below can easily achieve a 25% percent reduction in work-related vehicle trips that result in a reduction in trips generated by the project and parking demand. However, the analysis contained in this report does not include reductions based on TDM measures. Therefore, the estimates of trips to be generated by the proposed project as presented and evaluated within this study may represent an over-estimation of traffic and impacts associated with the proposed project. The project TDM program could include, but would not be limited to, the following elements to reduce vehicle trips:

- *Eco Pass or Clipper Card* for all employees, providing free rides on Santa Clara County's local transit agency, the Santa Clara Valley Transportation Authority (VTA)
- *25% Transit Subsidy* for transit agencies other than the VTA, including Caltrain, ACE, Capitol Corridor, BART, MUNI, and other
- *Monthly Vanpool Subsidy*
- *Commuter Tax Benefits* through WageWorks offering pre-tax deduction per month for transit and pre-tax deduction per month for parking
- *Free "Last Mile" Shuttles* to local train systems (e.g. Caltrain, Amtrak, ACE)
- *Free WiFi Commuter Buses* direct from areas like San Francisco and the TriValley area
- *Internal Carpool Matching Program* utilizing zip code matching
- *Regional Carpool Matching Program* through 511
- *Personalized Commute Assistance* offered by a Commute Coordinator
- *Preferred parking for Carpools and Vanpools* located near entrances to every building
- *Bicycle Lockers and/or Bicycle Racks* near entrances to every building
- *Showers* for cyclists and pedestrians, offering clean towel service, complimentary toiletries, hair dryers, and ironing boards
- *Intranet Site* featuring transit, bike, ridesharing and telework information
- *New Hire Orientation* presentations focusing on commute alternatives from Day 1
- *Centrally-Located Kiosks* with transit schedules, bike and transit maps, and other commute alternative information
- *Periodic Events* which connect employees with local transit agencies and transportation organizations (e.g. Spare the Air Fair, Bike to Work Day)
- *Onsite amenities* which allow employees to complete errands without a car, such as bicycle repair, dry cleaning, oil changes, carwash, haircuts, dental services, cafeteria, coffee bars, fitness center, massage services, mail and shipping services, convenience store, ATM, gift store.

**Table ES 1

# 1.

## Introduction

---

This report presents the results of the traffic impact analysis conducted for the proposed America Center Phase III project in North San Jose. The America Center III Project proposes modifications to the allowed amount of development under the existing Planned Development Zoning (PDC 03-24) within the Commercial Office/Research and Development (R&D) area of the America Center Development. The proposed project would increase the total allowed commercial office, R&D, and amenity space on the site by 190,000 square feet, from 900,000 to 1,090,000 square feet.

The project also includes a specific development; construction of a building with up to 216,350 sf of office space and the expansion of the approved, and currently under construction, 830 space parking garage to include a total of 1,870 parking spaces as well as 6,000 sf of amenity space. Additional parking for the project will be provided by 1,740 surface parking spaces. Access to the site is provided from America Center Drive, which extends from the northern terminus of Great America Parkway into the America Center. The project site location and the surrounding study area are shown on Figure 1. The project site plan is shown on Figure 2.

The project site is part of the approved America Center Project site for which a traffic study was completed in 1999. The America Center project included 900,000 square feet (s.f.) of office space, a 175-room hotel, and 25,000 s.f. of commercial/retail space. A total of 420,094 sf of office space and the 175-room hotel has been constructed on the site. Two more buildings containing 431,668 sf of office space, 16,000 sf of amenity space, and an 830-space parking garage are currently under construction. The 25,000 s.f. of commercial/retail space was planned adjacent to the Guadalupe River, just west of the Union Pacific Railroad line which is now a separate zoning district approved as part of PDC15-016 in March 2016. Once the four office buildings are completed, there is 32,238 s.f. of remaining office/R&D space entitlement provided on the project site that will be used by the proposed project.

## Scope of Study

The purpose of the study is to identify the potential traffic impacts related to the proposed project. The potential impacts related to the proposed rezoning and Building 5 development were evaluated following the standards and methodologies set forth by the Cities of San Jose and Santa Clara and the Santa Clara Valley Transportation Authority (VTA). The VTA administers the County Congestion Management Program (CMP).

The study includes an analysis of AM and PM peak-hour traffic conditions for 16 signalized intersections and two unsignalized intersections within the Cities of San Jose and Santa Clara as well as 12 directional freeway segments. The study intersections were selected based upon the estimated number of project trips through the intersection (10 or more trips per lane per hour). Any intersections outside of the study area to which the project would not add 10 or more trips per lane per hour, were not studied because the addition of project traffic would not be a sufficient amount to result in the degradation of intersection levels of service. The study intersections and freeway segments are identified below.

**Figure 1**  
**Site Location and Study Intersections**

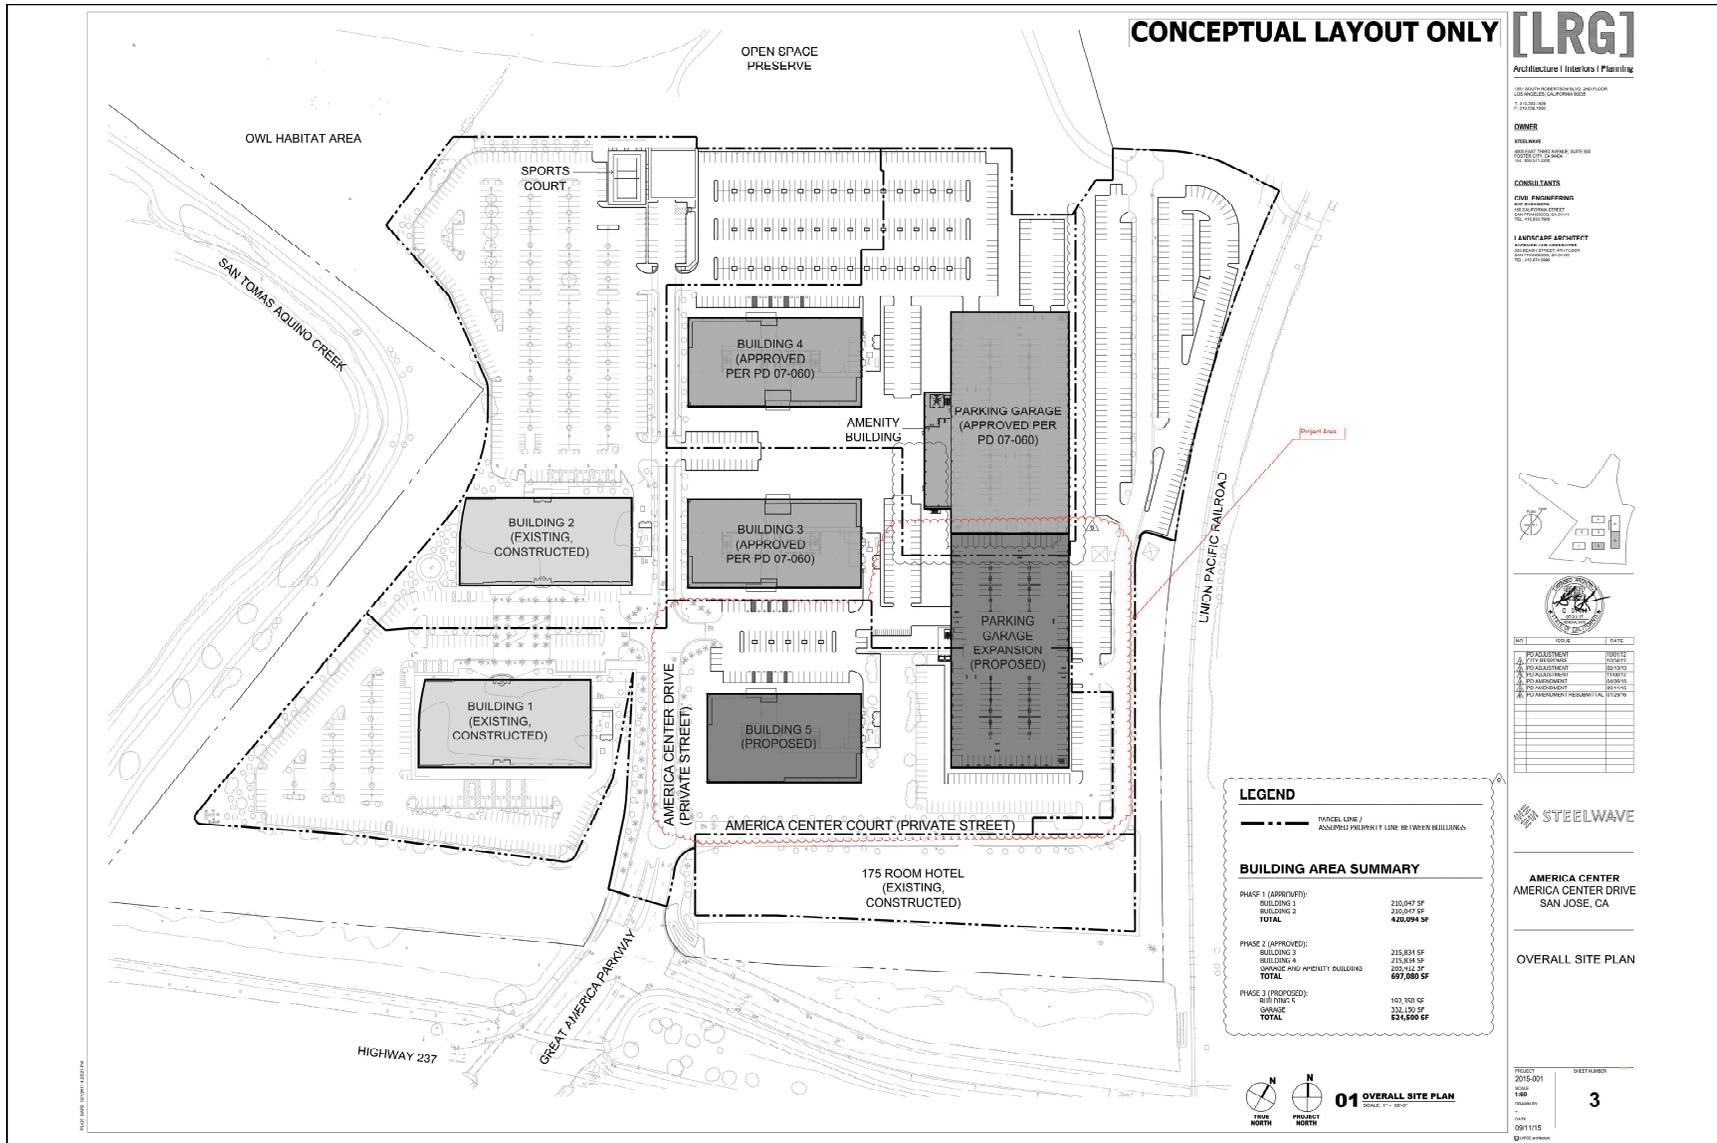

Figure 2  
Site Plan

## Study Intersections

### City of San Jose Study Intersections

1. Great America Parkway and Gold Street
2. Lafayette Street and Gold Street Connector
3. Great America Parkway and SR 237 (N)\*
4. Great America Parkway and SR 237 (S)\*

### City of Santa Clara Study Intersections

5. Great America Parkway and Great America Way
6. Great America Parkway and Alviso Road
7. Great America Parkway and Bunker Hill Lane
8. Great America Parkway and Tasman Drive\*
9. Great America Parkway and Old Glory Lane
10. Great America Parkway and Patrick Henry Drive
11. Great America Parkway and Mission College Boulevard\*
12. Great America Parkway and US 101 Northbound Ramps\*
13. Bowers Avenue and US 101 Southbound Ramps\*
14. Lafayette Street and Calle De Luna
15. Calle de Sol and Tasman Drive
16. Lick Mill Boulevard and Tasman Drive

### Unsignalized Study Intersections

17. America Center Drive and America Center Court (unsignalized)
18. Lafayette Street and Great America Way (unsignalized)

\* CMP Designated Intersection

## Study Freeway Segments

1. Eastbound SR 237 between N. Fair Oaks Avenue and Lawrence Expressway
2. Eastbound SR 237 between Lawrence Expressway and Great America Parkway
3. Eastbound SR 237 between Great America Parkway and North First Street
4. Eastbound SR 237 between North First Street and Zanker Road
5. Eastbound SR 237 between Zanker Road and McCarthy Boulevard
6. Eastbound SR 237 between McCarthy Boulevard and I-880
7. Westbound SR 237 between I-880 and McCarthy Boulevard
8. Westbound SR 237 between McCarthy Boulevard and Zanker Road
9. Westbound SR 237 between Zanker Road and North First Street
10. Westbound SR 237 between North First Street and Great America Parkway
11. Westbound SR 237 between Great America Parkway and Lawrence Expressway
12. Westbound SR 237 between Lawrence Expressway and N. Fair Oaks Avenue

The study also includes a site access operations analysis that includes signal warrant analysis at the America Center Court and America Center Drive.

Traffic conditions at all of the study intersections were analyzed for the weekday AM and PM peak hours. The weekday AM peak hour of traffic is generally between 7:00 and 9:00 AM and the weekday PM peak hour is typically between 4:00 and 6:00 PM. It is during these periods that the most congested traffic conditions occur on a typical weekday. Traffic conditions were evaluated for the following scenarios:

**Scenario 1: Existing Conditions.** Existing AM and PM peak hour traffic volumes were obtained from the City of San Jose, the 2014 CMP Annual Monitoring Report, and previously completed traffic studies in the project area.

- Scenario 2:** *Existing Plus Project Conditions.* Existing plus project peak hour traffic volumes were estimated by adding to existing traffic volumes the additional traffic generated by the project. Existing plus project conditions were evaluated relative to existing conditions in order to determine the effects the project would have on the existing roadway network.
- Scenario 3:** *Background Conditions.* Background traffic volumes were estimated by adding to existing peak hour volumes the projected volumes from approved but not yet completed developments. The added traffic from approved but not yet completed developments was provided by the City of San Jose in the form of the Approved Trips Inventory (ATI). Traffic volumes for approved projects within the City of Santa Clara also were included. Background conditions represent the baseline conditions to which project conditions are compared for the purpose of determining project impacts.
- Scenario 4:** *Background Plus Project Conditions.* Projected peak hour traffic volumes with the project were estimated by adding to background traffic volumes the additional traffic generated by the project. Background plus project conditions were evaluated relative to background conditions in order to determine potential project impacts.
- Scenario 5:** *Cumulative Conditions.* Cumulative conditions represent future traffic volumes on the future transportation network. Cumulative conditions include traffic growth projected to occur due to the approved development projects, the proposed project, and other proposed but not yet approved (pending) development projects in the study area.

## Methodology

This section presents the methods used to determine the traffic conditions for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

### Data Requirements

The data required for the analysis were obtained from previous traffic studies, new traffic counts, the Cities of San Jose and Santa Clara, the CMP Annual Monitoring Report, and field observations. The following data were collected from these sources:

- existing traffic volumes
- lane configurations
- signal timing and phasing
- average speeds on freeway segments
- a list of approved and planned projects
- approved trip inventory

### Analysis Methodologies and Level of Service Standards

Traffic conditions at the study intersections were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The analysis methods are described below.

### Signalized Intersections

Signalized study intersections are subject to the local municipalities' Level of Service standards. The Cities of San Jose and Santa Clara level of service methodology is TRAFFIX, which is based on the 2000 *Highway Capacity Manual* (HCM) method for signalized intersections. TRAFFIX evaluates signalized intersections operations on the basis of average control delay time for all vehicles at the intersection.

Since TRAFFIX is also the CMP-designated intersections level of service methodology, the Cities' methodologies employ the CMP defaults values for the analysis parameters. Each of the Cities' level of service standard for signalized intersections is LOS D or better. The correlation between average delay and level of service is shown in Table 1.

**Table 1**  
**Signalized Intersection Level of Service Definitions Based on Control Delay**

Level of Service	Description	Average Control Delay Per Vehicle (Sec.)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	Up to 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 20.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.1 to 80.0
F	Operation with delays unacceptable to most drivers occurring due to oversaturation, poor progression, or very long cycle lengths.	Greater than 80.0

Source: Transportation Research Board, *Highway Capacity Manual 2000*, (Washington, D.C., 2000)

### CMP Signalized Intersections

Since TRAFFIX is the designated level of service methodology for both the CMP and the Cities of San Jose and Santa Clara, the CMP study intersections are not analyzed separately, but rather are among the signalized intersections analyzed using TRAFFIX. The only difference between the Cities' and CMP analyses is that project impacts are determined on the basis of different level of service standards – the CMP level of service standard for signalized intersections is LOS E or better.

### Freeway Segments

As prescribed in the CMP technical guidelines, the level of service for freeway segments is estimated based on vehicle density. Density is calculated by the following formula:

$$D = V / (N * S)$$

Where:

D = density, in vehicles per mile per lane (vpml)

V = peak hour volume, in vehicles per hour (vph)

N = number of travel lanes

S = average travel speed, in miles per hour (mph)

The vehicle density on a segment is correlated to level of service as shown in Table 2. The CMP specifies that a capacity of 2,300 vehicles per hour per lane (vphpl) be used for mixed-flow lane segments that are three lanes or wider in one direction, and a capacity of 2,200 vphpl be used for mixed-flow lane segments that are two lanes wide in one direction. A capacity of 1,650 vphpl was used for high occupancy vehicle (HOV) lanes. The CMP defines an acceptable level of service for freeway segments as LOS E or better.

**Table 2**  
**Freeway Level of Service Based on Density**

Level of Service	Description	Density (vehicles/mile/lane)
A	Average operating speeds at the free-flow speed generally prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	0-11
B	Speeds at the free-flow speed are generally maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high.	>11-18
C	Speeds at or near the free-flow speed of the freeway prevail. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more vigilance on the part of the driver.	>18-26
D	Speeds begin to decline slightly with increased flows at this level. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels.	>26-46
E	At this level, the freeway operates at or near capacity. Operations in this level are volatile, because there are virtually no usable gaps in the traffic stream, leaving little room to maneuver within the traffic stream.	>46-58
F	Vehicular flow breakdowns occur. Large queues form behind breakdown points.	>58

## Report Organization

The remainder of this report is divided into six chapters. Chapter 2 describes existing conditions in terms of the existing roadway network, transit service, and existing bicycle and pedestrian facilities. Chapter 3 describes the method used to estimate project traffic and the resulting traffic conditions expected under Existing plus Project conditions. Chapter 4 presents the intersection levels of service under background conditions with the addition of traffic from approved development projects. Chapter 5 presents traffic conditions and potential project impacts and recommended mitigation measures under background plus project conditions. Chapter 6 presents the traffic conditions in the study area under cumulative conditions with the addition of traffic from development projects that are not yet approved. Chapter 7 presents the analysis of other transportation related issues, including site access and on-site circulation, and parking. Chapter 8 presents the conclusions of the traffic impact analysis.

## 2. Existing Conditions

---

This chapter describes the existing conditions for all of the major transportation facilities in the vicinity of the site, including the roadway network, transit service, and bicycle and pedestrian facilities. Also included are the existing levels of service of the key intersections and freeway segments in the study area.

### Existing Roadway Network

Regional access to the project site is provided via SR 237. Local access to the site is provided by Great America Parkway, America Center Drive, America Center Court, Great America Way, Tasman Drive, Lafayette Street, Gold Street Connector and Gold Street. These facilities are described below.

*SR 237* is a six-lane freeway and extends in an east/west direction between Sunnyvale and Milpitas, providing access to I-880 and US 101. Two of the six lanes (one in each direction) are designated as HOV/Toll lanes between Zanker Road and US 101. There are toll lanes (one in each direction) provided between Zanker Road and I-880. Access to the project site is provided via its interchange with Great America Parkway.

*Great America Parkway* is a north-south thoroughfare that begins at US 101 and extends northward to SR 237. Full interchanges are located at both US 101 and SR 237. Great America Parkway is primarily a six-lane roadway, with an additional northbound lane between Tasman Drive and US 101. Great America Parkway provides access to and from the project site via America Center Drive.

*America Center Drive* is a private, two-lane north/south roadway that extends from the northern terminus of Great America Parkway into the America Center development. America Center Drive provides access to the project site via its intersection with a minor perimeter roadway that runs along the south side of the proposed Building 5 and the America center office surface parking lots.

*America Center Court* is a private, two-lane roadway that extends from America Center Drive to the railroad track, where it turns 90 degrees and continues to the northern boundary of the project site. America Center Court provides direct access to the proposed Building 5.

*Great America Way* is an east/west roadway that runs between Great America Parkway and Lafayette Street. The roadway is a four-lane facility with two-way left-turn lane.

*Tasman Drive* is a divided four-lane east-west roadway that runs from Fair Oaks in Sunnyvale to I-880 in Milpitas. The VTA Mountain View-Winchester Light Rail Line runs within the median of Tasman Drive between Fair Oaks Avenue in Sunnyvale and I-880 in Milpitas. Tasman Drive provides access to the project site via Lafayette Street and Great America Parkway.

*Lafayette Street* is a divided four-lane north-south roadway that runs from Central Expressway to SR 237. Lafayette Street changes to an undivided four-lane roadway south of Central Expressway. Lafayette Street provides access to and from the project site via the Gold Street Connector.

*Gold Street Connector* is a two-lane east-west roadway that runs between Great America Parkway and Gold Street.

*Gold Street* is a north/south two-lane roadway that extends from the northern terminus of Lafayette Street to Elizabeth Street in Alviso.

## Existing Bicycle and Pedestrian Facilities

There are several bike lanes and bike paths in the vicinity of the project site. Bicycle facilities are divided into three classes of relative significance. Class I bikeways are bike paths that are physically separated from motor vehicles and offer two-way bicycle travel on a separate path. Class II bikeways are striped bike lanes on roadways that are marked by signage and pavement markings. Class III bikeways are bike routes and only have signs to help guide bicyclists on recommended routes to certain locations. Bicycle facilities in the project area consist of the following:

- Great America Parkway has bike lanes south of Great America Way to Chromite Drive.
- There are bike paths adjacent to the Guadalupe River and San Tomas Aquino Creek.
- The Guadalupe River Trail extends from south San Jose to Gold Street in Alviso.
- A bike path runs along San Tomas Aquino Creek and extends from Benton Street in Santa Clara to Great America Parkway and Sunnyvale Baylands Park.
- A bike path also is provided along the south side of SR 237 between North First Street and Lafayette Street and along north side of SR 237, Bay Trail, between Lafayette Street and East Caribbean Drive.

In addition, it is important to note California Vehicle Code CVC21200 states that a person riding a bicycle has all the rights and is subject to all the provisions applicable to motor vehicles. Therefore, bicyclists are permitted on virtually all public streets. The existing bicycle facilities within the study area are shown on Figure 3.

There are sidewalks along virtually all previously described local roadways in the study area, with a few exceptions, as well as the aforementioned bike/pedestrian paths. Within the study area, there are no sidewalks along the following roadways:

*America Center Drive* (private street) – There are no sidewalks on the east side of America Center Drive along the proposed Building 5 frontage, and either side of America Center Drive between the Gold Street Connector and the Building 5 frontage. Sidewalks are provided along both sides of America Center Drive north of the Building 5 frontage. There is an unpaved walkway provided along the west side of America Center Drive between the America Center office buildings and the Gold Street Connector.

*America Center Court* (private street) - There are no sidewalks provided along either side of America Center Court.

*Gold Street Connector* – Sidewalks are not provided along either side of the Gold Street Connector. However, a bike path is provided along the south side of the Gold Street Connector between Lafayette Street and Great America Parkway.

*Lafayette Street* - No sidewalks are present along either side of Lafayette Street between Great America Way and Calle De Luna.

## Existing Transit Service

Existing transit service to the study area is provided by the VTA and ACE. Regional transit is provided by Caltrain and ACE. The existing transit services are described below and shown on Figure 4.

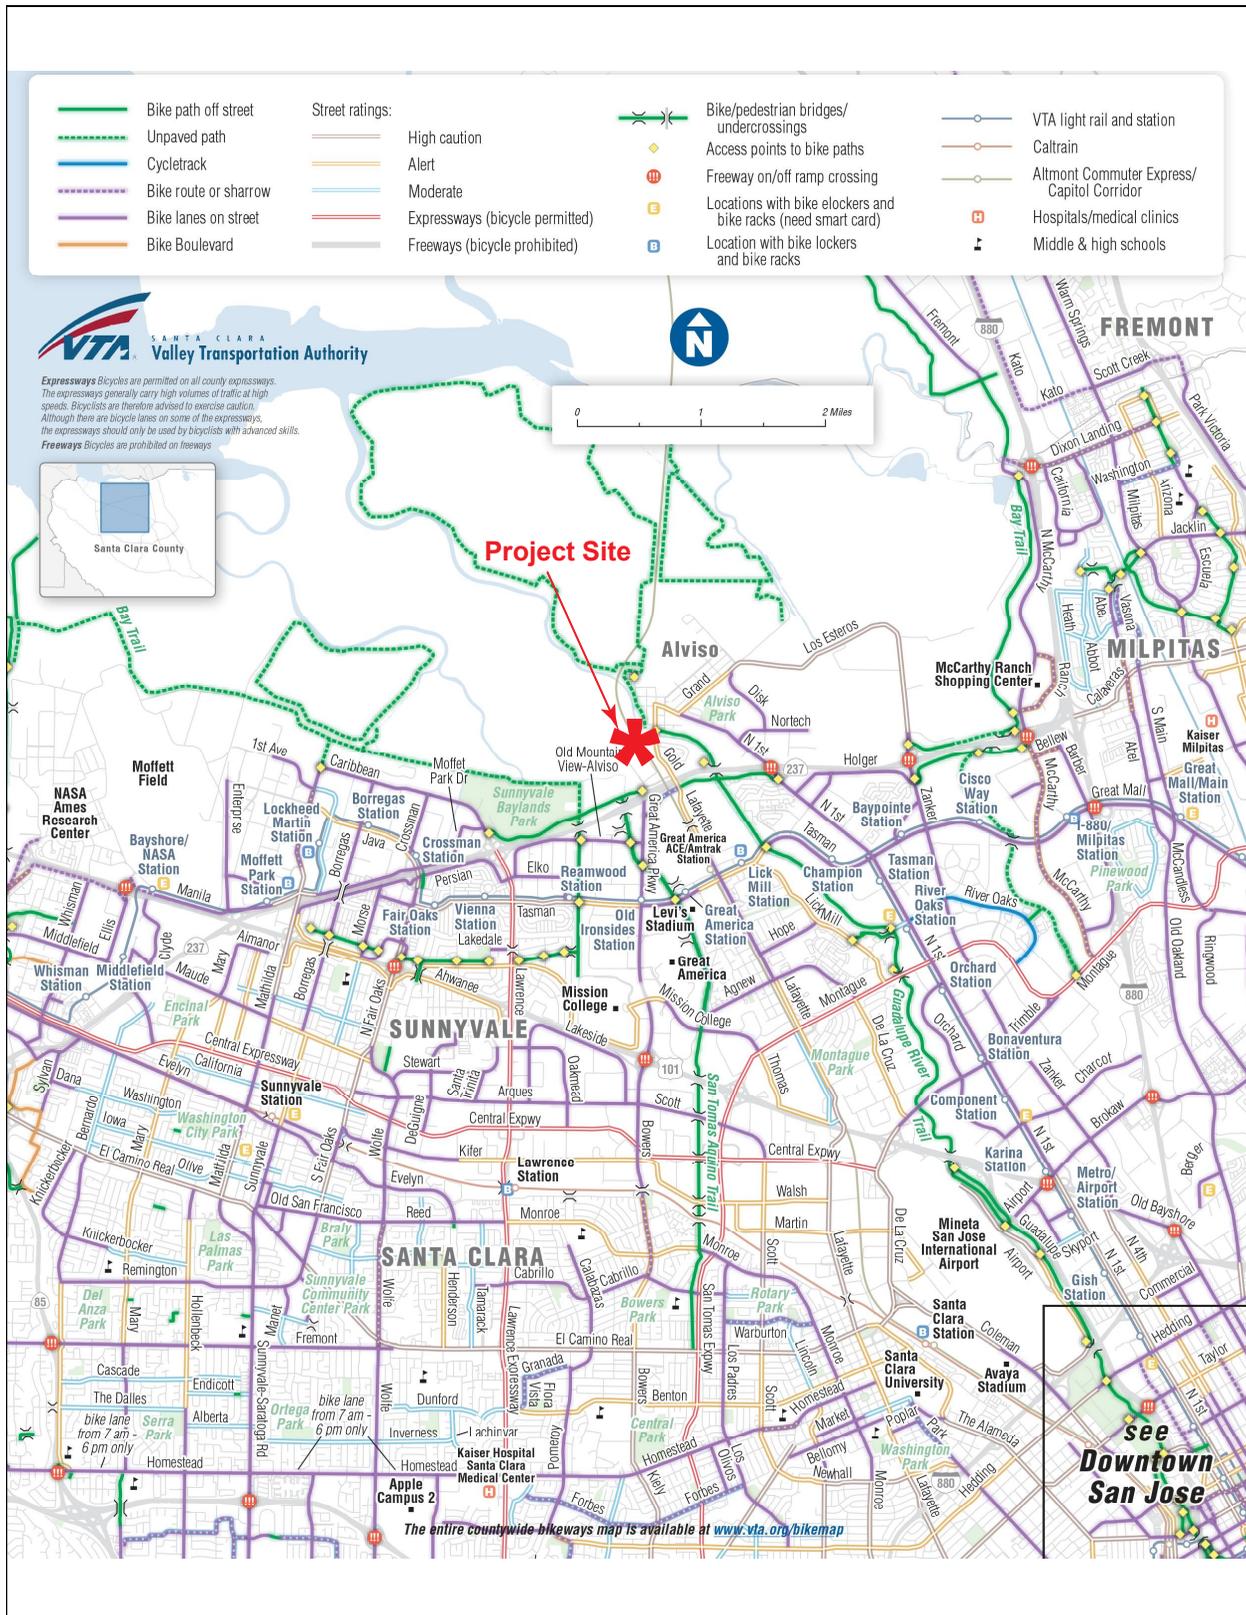

Figure 3 Existing Bicycle Facilities

## **Bus Service**

Existing bus service within the study area is provided by the VTA. However, the project site is not directly served by any transit services other than the ACE Shuttle. The nearest bus stops are located along Gold Street near its intersection with Taylor Street that is located approximately one mile from the project site and at the intersection of Tasman Drive and Old Ironsides Drive located approximately 1.5 miles from the project site.

**Local Route 55** operates on Tasman Drive in the study area. It runs between De Anza College in Cupertino and Old Ironsides Drive and Tasman Drive (Great America) in Santa Clara. Route 55 runs between 5:30 AM and 11:00 PM with 15 to 30-minute headways during the AM and PM peak hours.

**Local Route 57** operates on Great America Parkway in the study area. It runs between West Valley College in Saratoga and Old Ironsides Drive and Tasman Drive (Great America) in Santa Clara. Route 57 runs between 5:45 AM and 11:00 PM with 30-minute headways during the AM and PM peak hours.

**Local Route 58** provides service between West Valley College and Alviso via North First Street. Route 58 operates between 6:00 AM and 8:15 PM along North First Street in the project study area, with 30-minute headways during the weekday peak commute hours. The nearest bus stop for Route 58 is situated near the intersection of Gold Street and Taylor Street.

**Local Route 60** operates on Great America Parkway in the study area. It runs between the Winchester Transit Center in Campbell and Old Ironsides Drive and Tasman Drive (Great America) in Santa Clara. Route 60 runs between 5:30 AM and 11:00 PM with 15- to 30-minute headways during the AM and PM peak hours.

**Express Bus Route 121** is an express bus (limited stops) with a scheduled stop at Old Ironsides and Tasman. It runs between the Gilroy Transit Center and the Lockheed Martin Transit Center. Express Route 121 provides service on weekdays only and runs in the northbound direction in the morning (between 4:30 and 9:20 AM) and in the southbound direction in the evening (between 3:00 and 7:40 PM) with 30- to 60-minute headways.

**Express Bus Route 140** is an express bus (limited stops) with a scheduled stop at Old Ironsides and Tasman. It provides service between the Fremont BART station and Mission College. Express Route 140 operates on weekdays only and runs in the southbound direction during the AM commute period (between 7:10 and 9:50 AM) and northbound during the PM commute period (between 4:20 and 7:10 PM) with approximately 50-minute headways.

**Limited Stop Route 321** provides service between Great Mall/Main Transit Center in Milpitas and Lockheed Martin Moffett Industrial Park in Sunnyvale. The nearest stop is at Patrick Henry and Democracy Way. It provides service on weekdays only with one run each direction: westbound run at 8:10 AM at the Great Mall Transit Center and eastbound at 5:50 PM at the Lockheed Martin Transit Center. Route 321 observes all limited stops along its route in the study area.

**Limited Stop Route 330** operates on Tasman Drive on its route between Almaden Expressway and Camden and the I-880/Milpitas Light Rail Station on Tasman Drive at Alder Drive. It operates northbound with 30-minute headways during the AM peak hours and southbound with 30 to 55 minute headways during the PM peak hours. Route 330 observes all limited stops along its route in the study area.

## **ACE**

The Altamont Commuter Express (ACE) provides commuter rail service between the Central Valley and Silicon Valley. ACE serves the Great America Transit Station located along Stars and Stripes Boulevard. Four trains are in operation during weekday commuting hours. Shuttle service from the station to employment centers, including the America Center development, are provided by eight ACE shuttles.

**ACE Green Shuttle (823)** operates on Tasman Drive and Great America Parkway between its route from the Great America ACE Station and the America Center campus. There are scheduled stops at the

Convention Center and Old Ironsides LRT Stations along Tasman Drive, which also provides connections to other VTA bus lines. It provides service on weekdays only with 4 runs in the westbound direction in the morning (between 6:16 and 9:21 AM) and 4 runs in the eastbound direction in the evening (between 3:24 and 6:39 PM).

### ***Light Rail Transit (LRT) Service***

Light Rail Transit (LRT) service is provided in the project area by VTA. The nearest LRT station, the Old Ironsides LRT Station, is located along Tasman Drive at Old Ironsides Drive approximately 1.5 miles south of the project site, and serves one LRT line, Mountain View to Winchester. The Mountain View – Winchester Line LRT line, operates from 4:45 AM to 12:45 AM) with 10-15-minute headways during peak commute and midday hours. The Mountain View – Winchester Line provides service between downtown Mountain View and Campbell/Los Gatos via downtown San Jose.

## **Existing Intersection Lane Configurations**

The existing lane configurations at the study intersections were determined by observations in the field and are shown on Figure 5.

## **Existing Traffic Volumes**

Existing peak-hour traffic volumes were obtained from the City of San Jose, the 2014 CMP Annual Monitoring Report, and previously completed traffic studies. The existing peak-hour intersection volumes are shown on Figure 6. Peak hour intersection turning movement volumes for all intersections and study scenarios are tabulated in Appendix C.

## **Existing Intersection Levels of Service**

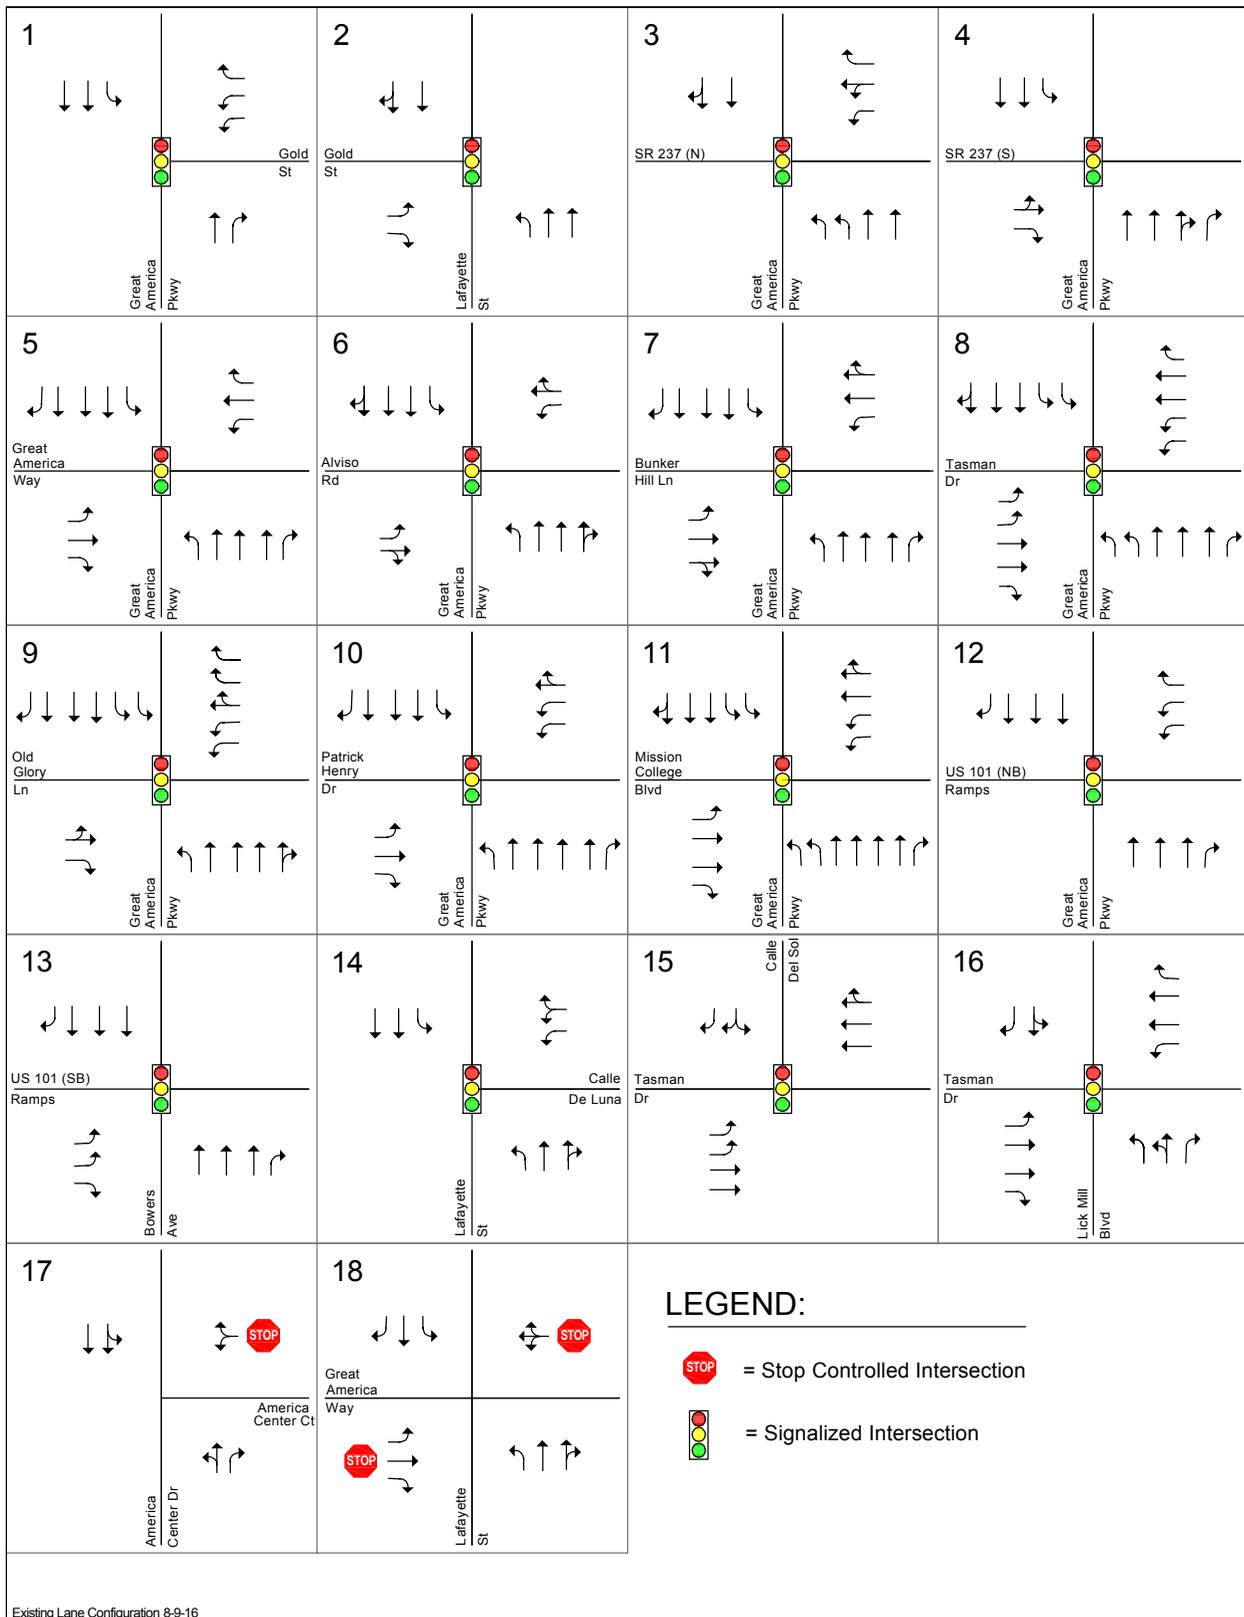

The results of the intersection level of service analysis under existing conditions are summarized in Table 3. The results of the level of service analysis show that, measured against the applicable municipal and CMP standards, all of the study intersections currently operate at an acceptable LOS D or better during both the AM and PM peak hours of traffic. The intersection level of service calculation sheets are included in Appendix D.

## **Existing Freeway Levels of Service**

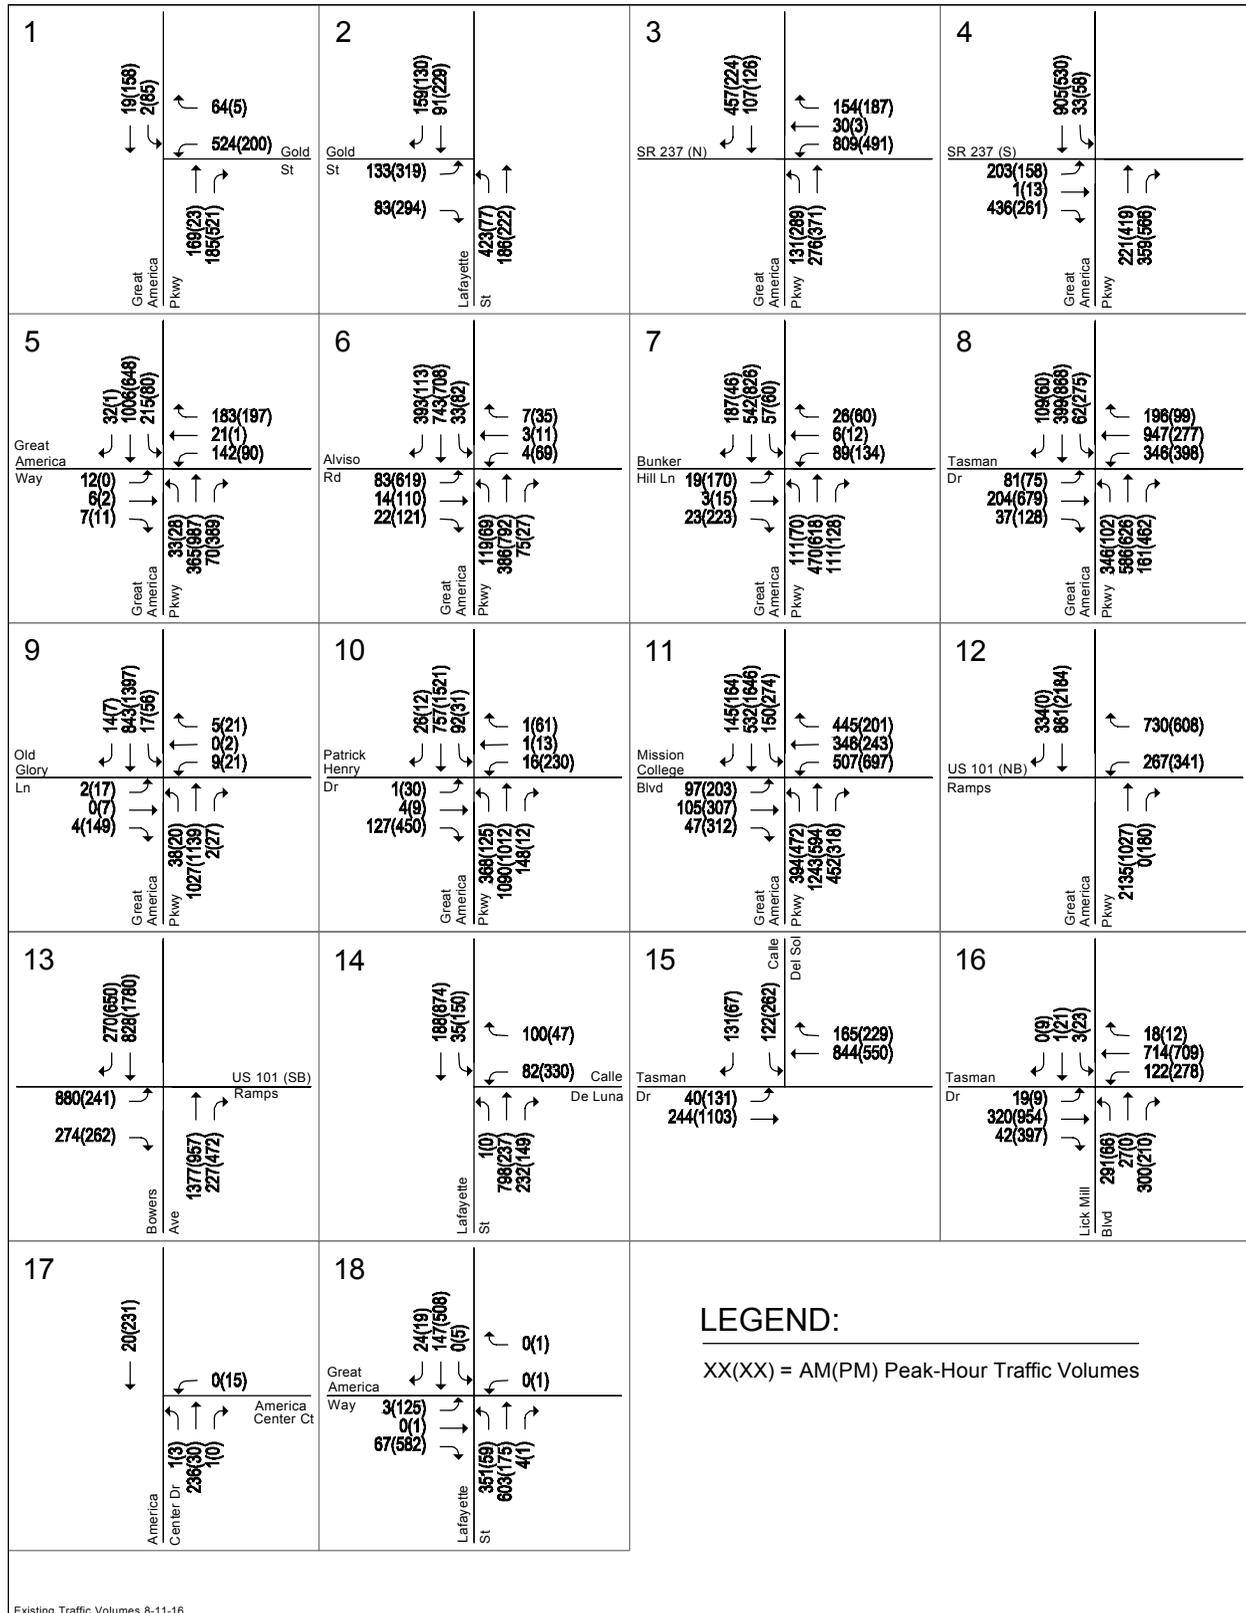

Traffic volumes for the study freeway segments were obtained from the 2014 CMP Annual Monitoring Report, which contains the most recent data collected for freeway segments located in Santa Clara County. The results of the analysis are summarized in Table 4. The results show that seven of the 12 directional study freeway segments currently operate at unacceptable LOS F conditions during at least one peak hour of traffic. The results also show that one of the directional HOV lane segments analyzed currently operate at unacceptable LOS F conditions during at least one of the peak hours.

### ***Mixed-Flow Lane Segment Unacceptable LOS F:***

1. Eastbound SR 237 between N. Fair Oaks Avenue and Lawrence Expressway (PM Peak Hour)
2. Eastbound SR 237 between Lawrence Expressway and Great America Parkway (PM Peak Hour)
3. Eastbound SR 237 between Great America Parkway and North First Street (PM Peak Hour)
4. Eastbound SR 237 between North First Street and Zanker Road (PM Peak Hour)
6. Eastbound SR 237 between McCarthy Boulevard and I-880 (PM Peak Hour)
7. Westbound SR 237 between I-880 and McCarthy Boulevard (AM Peak Hour)
8. Westbound SR 237 between McCarthy Boulevard and Zanker Road (AM & PM Peak Hours)

***HOV Lane Segment Unacceptable LOS F:***

7. Westbound SR 237 between I-880 and McCarthy Boulevard (AM Peak Hour)

**Observed Existing Traffic Conditions**

Traffic conditions in the field were observed in order to identify existing operational deficiencies and to confirm the accuracy of calculated levels of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to intersection level of service, and (2) to identify any locations where the level of service calculation does not accurately reflect level of service in the field.

Field observations revealed the following operational problems that may not be reflected in level of service calculations:

Ramp metering on the eastbound SR 237 on-ramp from Great America Parkway causes vehicular queues to extend from the ramp back onto northbound Great America Parkway. However, the queue of vehicles does not disrupt traffic flow along Great America Parkway.

### 3.

## Existing Plus Project Conditions

---

This chapter describes existing traffic conditions with the addition of the traffic that would be generated by the proposed project. Existing plus project traffic conditions could potentially exist if the project was constructed and occupied prior to the other approved projects in the area. It is unlikely that this traffic condition would occur, since other approved projects expected to add traffic to the study area would likely be built and occupied during the time the project is going through the development review and construction process. This scenario describes a less congested traffic condition, since it ignores any potential traffic from prior approvals. Existing plus project conditions also does not include any planned and funded roadway improvements that have not been constructed.

### Transportation Network under Existing Plus Project Conditions

It is assumed in this analysis that the transportation network under existing plus project conditions would be the same as the existing transportation network.

### Project Description

The proposed project consists of a Planned Development rezoning that would allow the construction of up to 216,350 sf additional office uses on the site. The evaluation of existing plus project conditions requires the analysis of the entire proposed project against existing traffic conditions. Therefore, a trip credit due to the remaining entitlement of the approved 32,238 sf of office/R&D space is not applied and the entire proposed 216,350 sf of office space is evaluated under existing plus project conditions. The 6,000 sf of proposed amenity space within the parking garage is not counted toward project trip generation as it would serve the proposed use and is not anticipated to generate additional vehicle trips.

### Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the site is estimated for the AM and PM peak hours. As part of the project trip distribution step, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment step, the project trips are assigned to specific streets and intersections in the study area. These procedures are described further in the following sections.

### ***Trip Generation***

Through empirical research, data have been collected that correlate to common land uses their propensity for producing traffic. Thus, for the most common land uses there are standard trip generation rates that can be applied to help predict the future traffic increases that would result from a new development. Project trip estimates are based on trip generation rates obtained from the Institute of Transportation Engineers' (ITE's) *Trip Generation*, Ninth Edition, 2012.

Based on the ITE trip generation rates, it is estimated that the proposed 216,350 sf of office building uses would generate 2,386 daily trips, with 338 trips (297 inbound and 41 outbound) occurring during the AM peak hour and 322 trips (55 inbound and 267 outbound) occurring during the PM peak hour. The project trip generation estimates are presented below in Table 5.

### ***Trip Distribution***

Peak hour project traffic was distributed to the transportation network based on existing travel patterns on the surrounding roadway system and the locations of complementary land uses. The project trip distribution pattern is shown graphically on Figure 7.

### ***Trip Assignment***

The peak-hour trips associated with the proposed project were added to the transportation network in accordance with the distribution pattern discussed above. Figure 8 shows the gross trip assignment of project traffic on the local transportation network. A tabular summary of project traffic at each study intersection is contained in Appendix C.

## **Existing Plus Project Traffic Volumes**

Project trips, as represented in the above project trip assignment, were added to existing traffic volumes to obtain existing plus project traffic volumes. The existing plus project traffic volumes are shown on Figure 9. Traffic volumes for all components of traffic are tabulated in Appendix C.

## **Existing Plus Project Intersection Analysis**

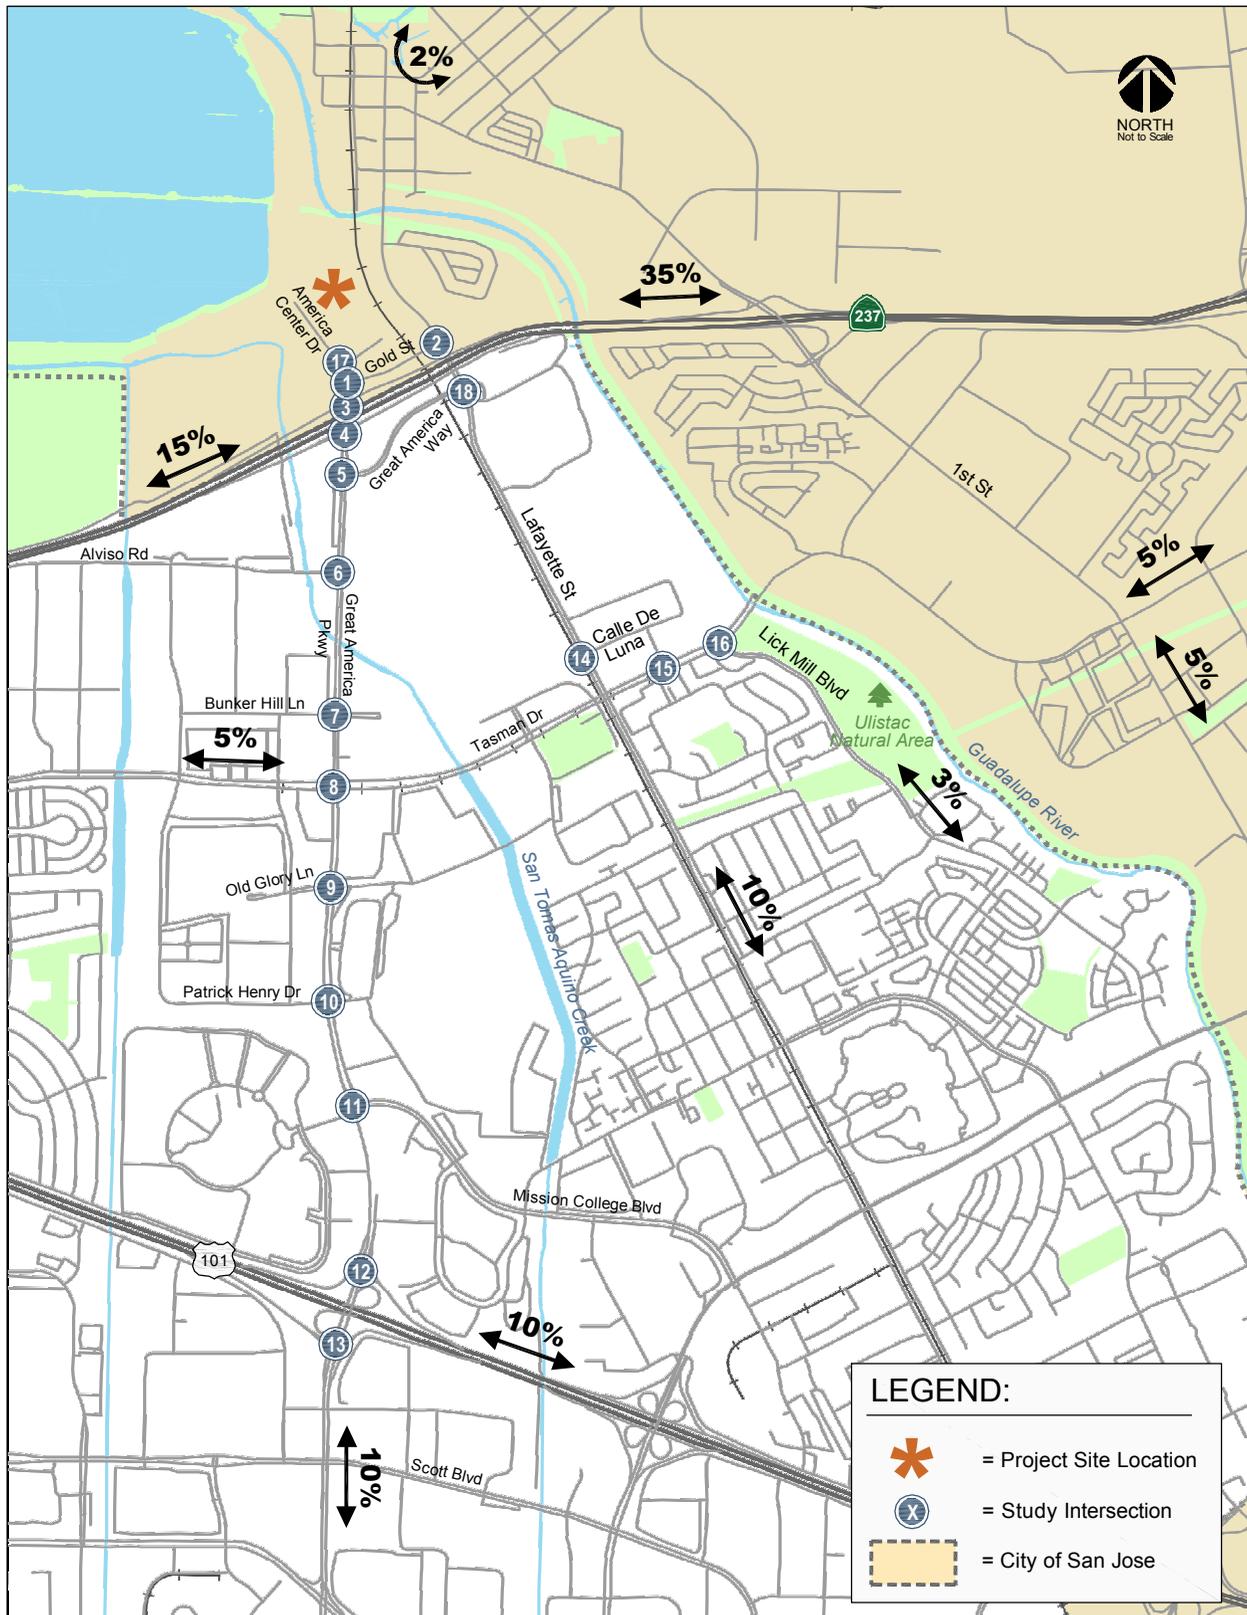

The results of the intersection level of service analysis under existing plus project conditions are summarized in Table 6. The results of the level of service analysis show that, measured against the applicable municipal and CMP standards, all of the study intersections are projected to operate at LOS D or better during both the AM and PM peak hours under existing plus project conditions.

The level of service calculation sheets are included in Appendix D.

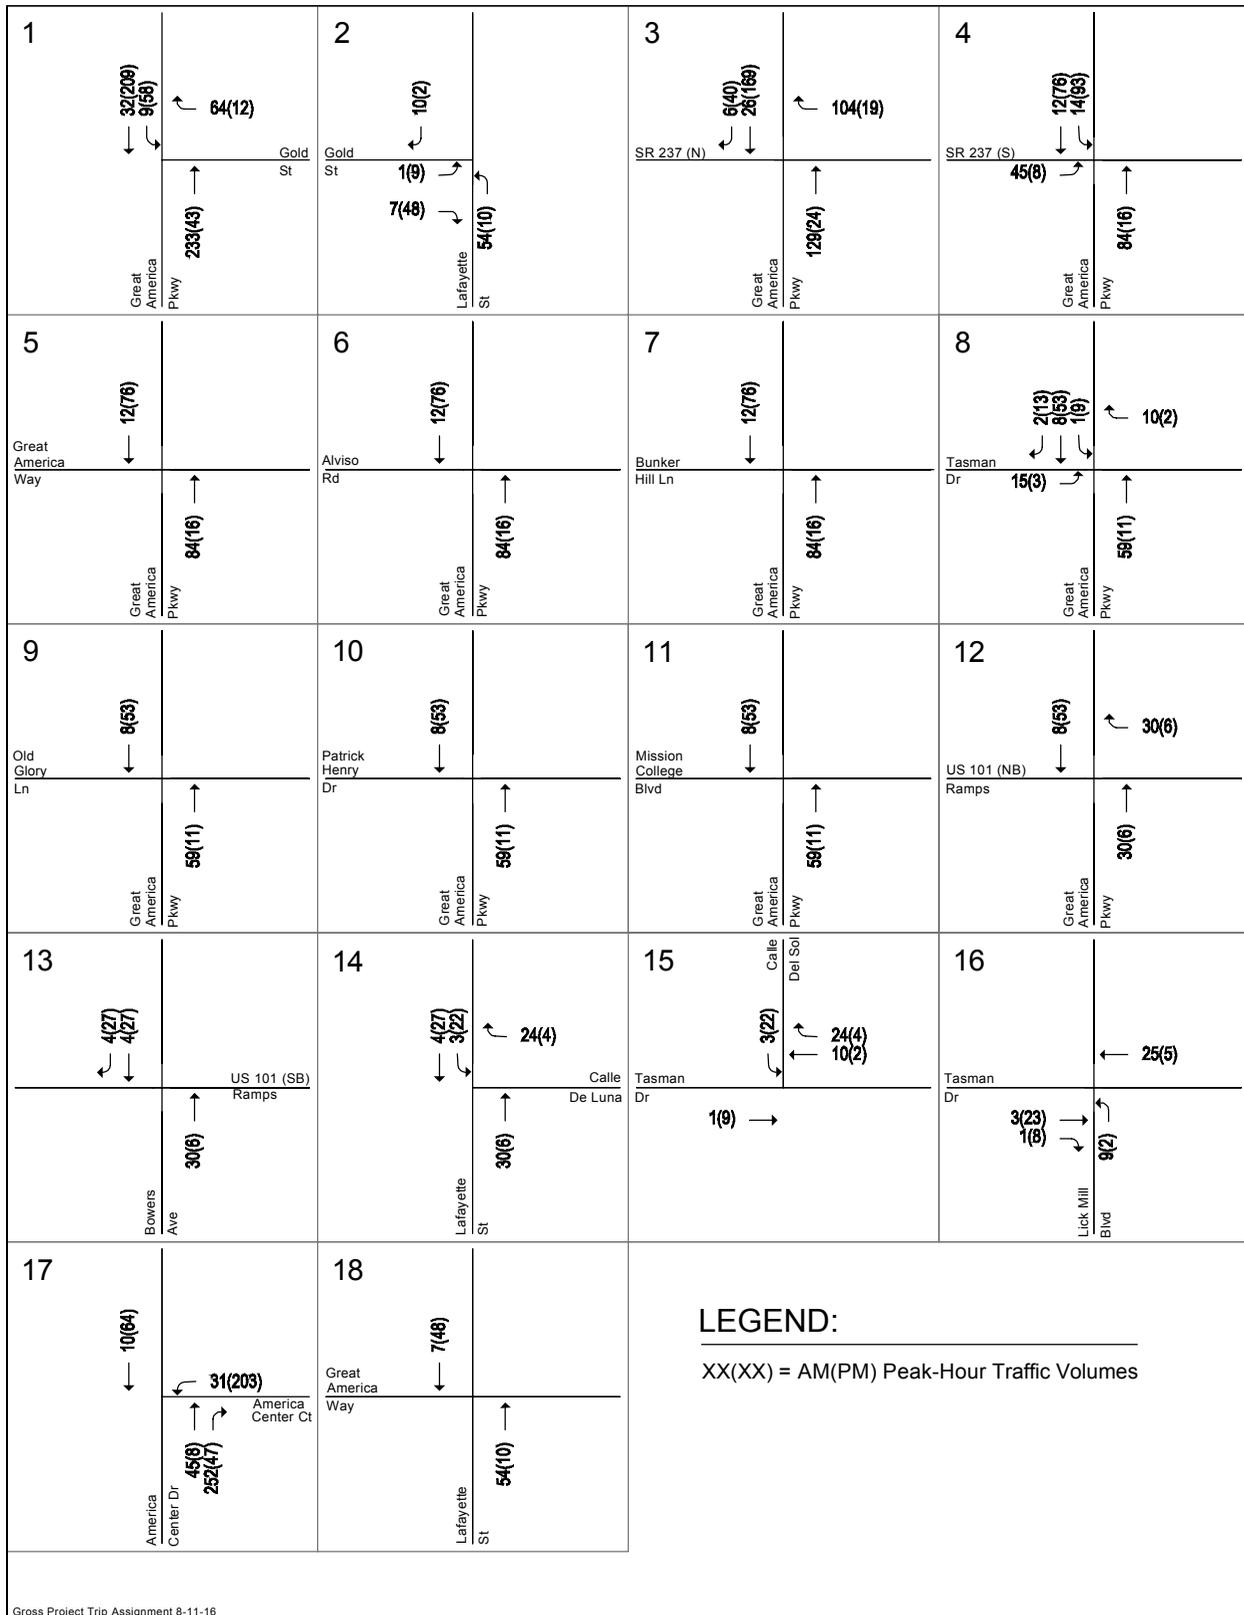

**Table 5  
Existing Plus Project Trip Generation Estimates**

Land Use	Size	Daily		AM Peak-Hour						PM Peak-Hour						
		Rate	Trip	PK-Hr Rate	Split		Trip		PK-Hr Rate	Split		Trip				
				Rate	In	Out	In	Out	Total	Rate	In	Out	In	Out	Total	
<b>Proposed Land Use</b>																
General Office Building (ITE Land Use Code 710) <sup>1</sup>	216,350 s.f.	11.03	2,386	1.56	88%	12%	297	41	338	1.49	17%	83%	55	267	322	

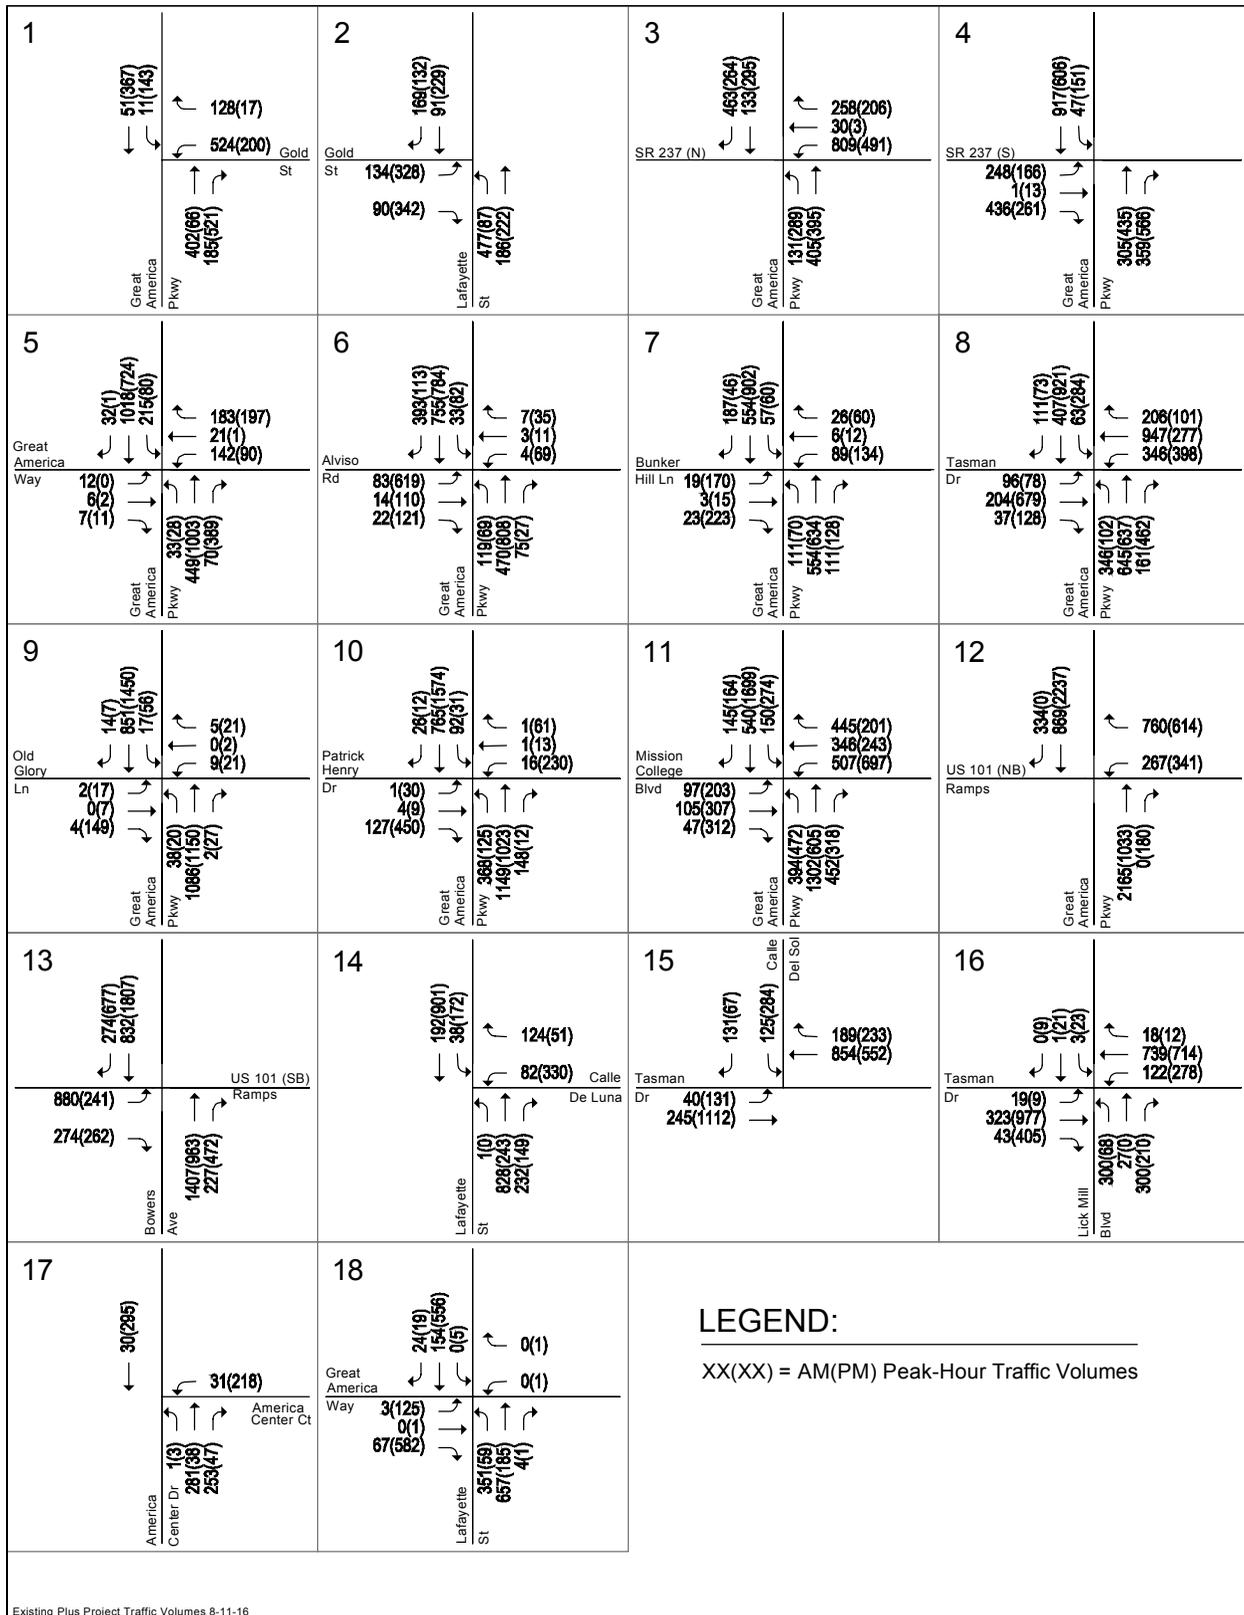

Notes:  
<sup>1</sup>The average trip generation rate from the ITE Trip Generation Manual (9th Edition, 2012) was used.  
 The 6,000 sf of proposed amenity space within the parking garage is not counted toward project trip generation as it would serve the proposed use and is not anticipated to generate additional vehicle trips.

## 4. Background Conditions

---

This chapter presents background traffic conditions, which are defined as conditions just prior to completion of the proposed project. It describes the planned transportation system, the procedure used to determine background traffic volumes, and the resulting traffic conditions. The background scenario predicts a realistic traffic condition that would occur as approved development gets built and occupied.

### Background Transportation Network

It is assumed in this analysis that the transportation network under background conditions would be the same as the existing transportation network with the exception of the following improvements. The improvements were identified as mitigation measures to be completed by the City of Santa Clara Capital Improvement Program (CIP) or other approved development projects in the study area.

*Great America Parkway and Mission College Boulevard* – Addition of a third westbound left-turn lane, fourth southbound through lane, third northbound left-turn lane, and separate westbound right-turn lane. (CIP)

*Great America Parkway and Tasman Drive* – Addition of a second northbound left-turn lane (Yahoo!)

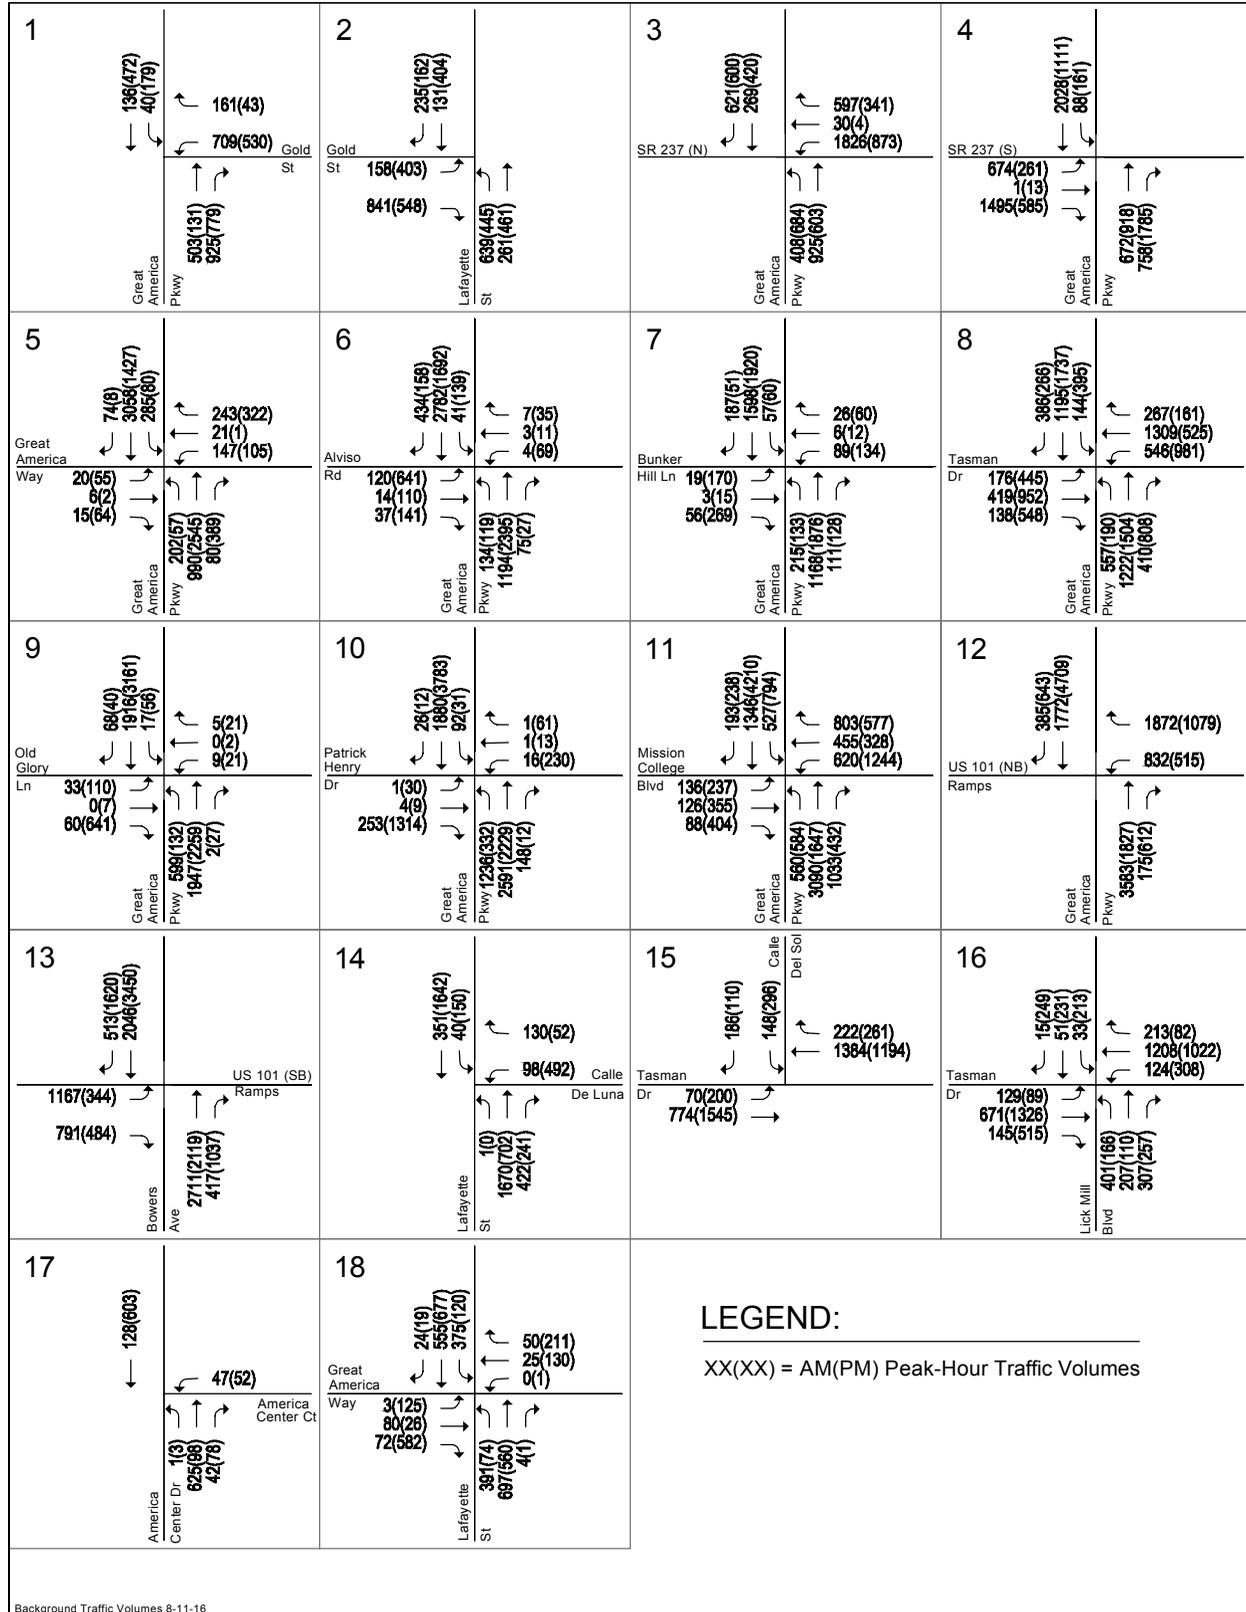

*Great America Parkway and Old Glory Lane* – Addition of a separate southbound right-turn lane (CityPlace)

*Great America Parkway and Patrick Henry Drive* – Addition of a second northbound left-turn lane and eastbound free-right-turn lane. The eastbound right-turn lane includes the addition of a fourth southbound lane on Great America Parkway between Patrick Henry Drive and Mission College Boulevard. (Yahoo!)

### Background Traffic Volumes

Background peak hour traffic volumes were estimated by adding to existing volumes the estimated traffic from approved but not yet constructed developments. The added traffic from approved but not yet constructed developments was obtained from the City of San Jose's Approved Trips Inventory (ATI) database. Traffic generated by approved projects within the City of Santa Clara also were included in the background traffic volumes.

Background traffic volumes are shown on Figure 10. The approved trips and traffic volumes for all components of traffic are tabulated in Appendix C. The ATI is contained in Appendix B.

**Figure 10**  
**Background Traffic Volumes**

## Intersection Levels of Service Under Background Conditions

The results of the intersection level of service analysis under background conditions are summarized in Table 7. The results show that, measured against the applicable municipal and CMP level of service standards, the following five intersections are projected to operate at an unacceptable LOS during at least one peak hour under background conditions:

### ***City of San Jose Study Intersections***

2. Lafayette Street and Gold Street Connector (AM Peak Hour)
3. Great America Parkway and SR 237 (N)\* (AM Peak Hour)

### ***City of Santa Clara Study Intersections***

6. Great America Parkway and Alviso Road (AM & PM Peak Hours)
11. Great America Parkway and Mission College Boulevard\* (PM Peak Hour)
16. Lick Mill Boulevard and Tasman Drive (PM Peak Hour)

\* Denotes CMP Intersection

All other study intersections are projected to operate at acceptable levels during both the AM and PM peak hours of traffic when measured against the applicable municipal and CMP level of service standards. The intersection level of service calculation sheets are included in Appendix D.

**Table 7**  
**Background Intersection Levels of Service**

Study Number	Intersection	Location	LOS Standard	Peak Hour	Existing		Background

 Entries denoted in **bold** indicate conditions that exceed the applicable level of service standard.

## 5. Background Plus Project Conditions

---

This chapter describes near-term traffic conditions that most likely would occur when the project is complete. It includes a description of the significance criteria used to establish what constitutes a project impact, a description of the transportation system under background plus project conditions, the method by which project traffic is estimated, and any impacts caused by the project. Background plus project conditions were evaluated relative to background conditions in order to determine potential project impacts. This traffic scenario represents a more congested traffic condition than the existing plus project scenario, since it includes traffic generated by approved projects in the area that are built and occupied.

### Significant Impact Criteria

Significance criteria are used to establish what constitutes an impact. Impacts on intersections are based on the significance criteria and thresholds of the jurisdiction in which the intersection is located. For this analysis, significance criteria for impacts on intersections are based on the Cities of San Jose and Santa Clara Level of Service standards. Project impacts also were analyzed according to the County Congestion Management Program (CMP) methodology for the three CMP study intersections.

#### *City of San Jose Definition of Significant Intersection Impacts*

The project is said to create a significant adverse impact on traffic conditions at a signalized intersection in the City of San Jose if for either peak hour:

1. The level of service at the intersection degrades from an acceptable LOS D or better under background conditions to an unacceptable LOS E or F under background plus project conditions, or
2. The level of service at the intersection is an unacceptable LOS E or F under background conditions and the addition of project trips causes both the critical-movement delay at the intersection to increase by four (4) or more seconds *and* the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

An exception to this rule applies when the addition of project traffic reduces the amount of average stopped delay for critical movements (i.e., the change in average stopped delay for critical movements is negative). In this case, the threshold of significance is an increase in the critical V/C value by .01 or more.

A significant impact by City of San Jose standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to background conditions or better.

### ***City of Santa Clara Definition of Significant Intersection Impacts***

The project is said to create a significant adverse impact on traffic conditions at a non-CMP signalized intersection in the City of Santa Clara if for either peak hour:

1. The level of service at the intersection degrades from an acceptable level (LOS D or better at all city-controlled intersections and LOS E or better at all expressway intersections) under background conditions to an unacceptable level (LOS E or F at city-controlled intersections and LOS F at expressway intersections) under project conditions, or
2. The level of service at the intersection is an unacceptable level (LOS E or F at city-controlled intersections and LOS F at expressway intersections) under background conditions and the addition of project trips causes the average critical delay to increase by four (4) or more seconds *and* the volume-to-capacity ratio (V/C) to increase by 0.01.

An exception to this rule applies when the addition of project traffic reduces the amount of average delay for critical movements (i.e., the change in average delay for critical movements is negative). In this case, the threshold of significance is an increase in the critical V/C value by 0.01 or more.

A significant impact by the City of Santa Clara standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to an acceptable level or no worse than background conditions.

### ***Conformance to the CMP Standard***

Based on CMP criteria, a project would fail to meet the CMP or County Expressway intersection standard if the additional project traffic caused one of the following during either peak hour:

1. The level of service at the intersection degrades from an acceptable LOS E or better under background conditions to an unacceptable LOS F under project conditions, or
2. The level of service at the intersection is an unacceptable LOS F under background conditions and the addition of project trips causes both the critical-movement delay at the intersection to increase by four (4) or more seconds *and* the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

An exception to this rule applies when the addition of project traffic reduces the amount of average delay for critical movements (i.e. the change in average delay for critical movements is negative). In this case, the threshold of significance is an increase in the critical V/C value by .01 or more.

A significant impact by CMP standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to background conditions or better.

### ***CMP Definition of Significant Freeway Segment Impacts***

The CMP defines an acceptable level of service for freeway segments as LOS E or better. A project is said to create a significant impact on traffic conditions on a freeway segment if for either peak hour:

1. The level of service on the freeway segment degrades from an acceptable LOS E or better under existing conditions to an unacceptable LOS F under background plus project conditions, or
2. The level of service on the freeway segment is LOS F under background plus project conditions and the number of project trips on that segment constitutes at least one percent of capacity on that segment.

A significant impact by CMP standards is said to be satisfactorily mitigated when measures are implemented that would restore freeway conditions to background conditions or better.

## Transportation Network Under Background Plus Project Conditions

It is assumed in this analysis that the transportation network under project conditions would be the same as described under background conditions.

### Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the site is estimated for the AM and PM peak hours. As part of the project trip distribution step, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment step, the project trips are assigned to specific streets and intersections in the study area. These procedures are described further in the following sections.

#### *Trip Generation*

Through empirical research, data have been collected that correlate to common land uses their propensity for producing traffic. Thus, for the most common land uses there are standard trip generation rates that can be applied to help predict the future traffic increases that would result from a new development. Project trip estimates are based on trip generation rates obtained from the Institute of Transportation Engineers' (ITE's) *Trip Generation*, Ninth Edition, 2012.

To maintain consistency with the original traffic analysis prepared for the remaining entitled 32,238 s.f. of R&D space on the project site, trip generation estimates as presented in the traffic analysis completed by Korve Engineering in 2004 were used for the entitled R&D space. The traffic estimated to be generated by the approved 32,238 s.f. of R&D space on the project site was subtracted from the gross project trips for the proposed office space to calculate the additional traffic that would be generated by the proposed additional office space, or the net generated project trips.

Based on the ITE trip generation rates, it is estimated that the proposed office space on the project site would generate a net additional 2,141 daily trips, with 299 trips (266 inbound and 33 outbound) occurring during the AM peak hour and 288 trips (52 inbound and 236 outbound) occurring during the PM peak hour when compared to the previously approved project. The project trip generation estimates are presented below in Table 8.

#### *Trip Distribution and Assignment*

The trip distribution pattern for the proposed project was estimated based on traffic patterns on the surrounding roadway system and on the locations of complementary land uses. The project trip distribution pattern is shown graphically on Figure 7 in Chapter 3.

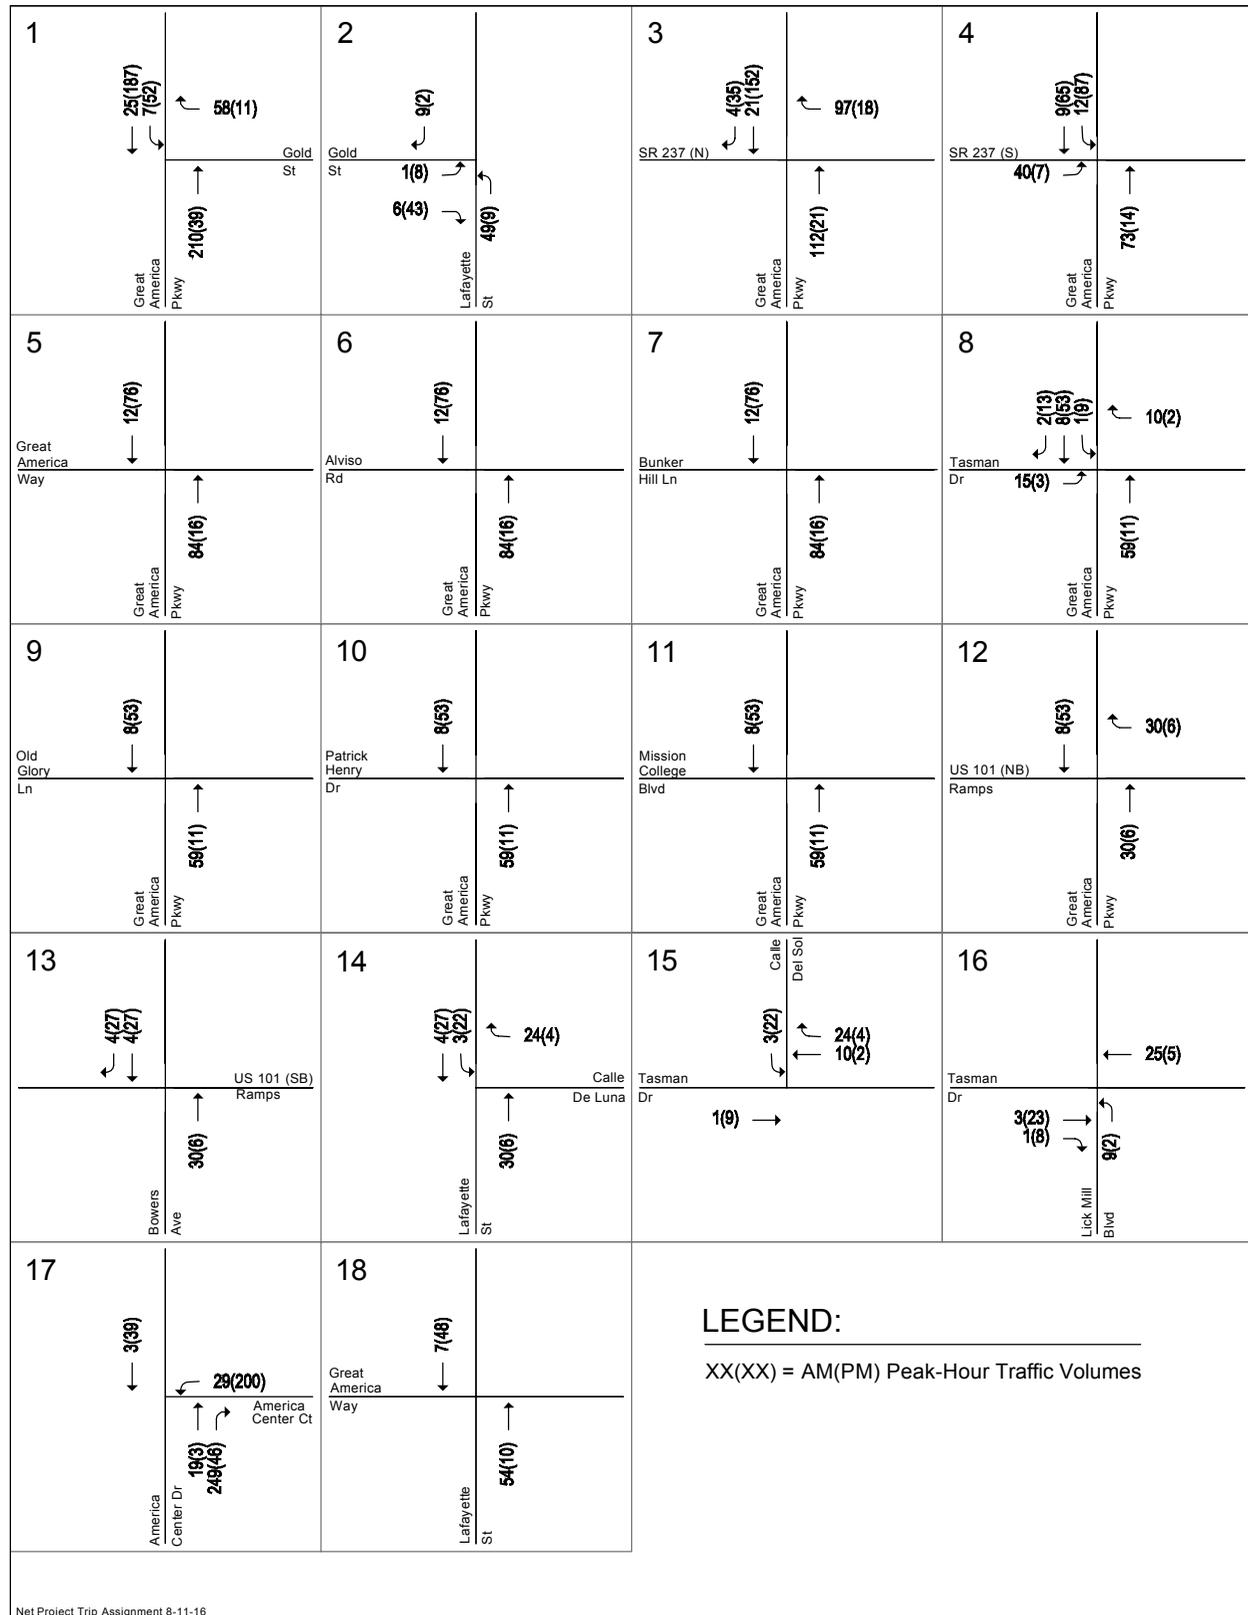

The peak-hour trips associated with the proposed project were added to the transportation network in accordance with the distribution pattern discussed above. Figure 11 shows the assignment of net project traffic on the local transportation network. A tabular summary of project traffic at each study intersection is contained in Appendix C.

## Background Plus Project Traffic Volumes

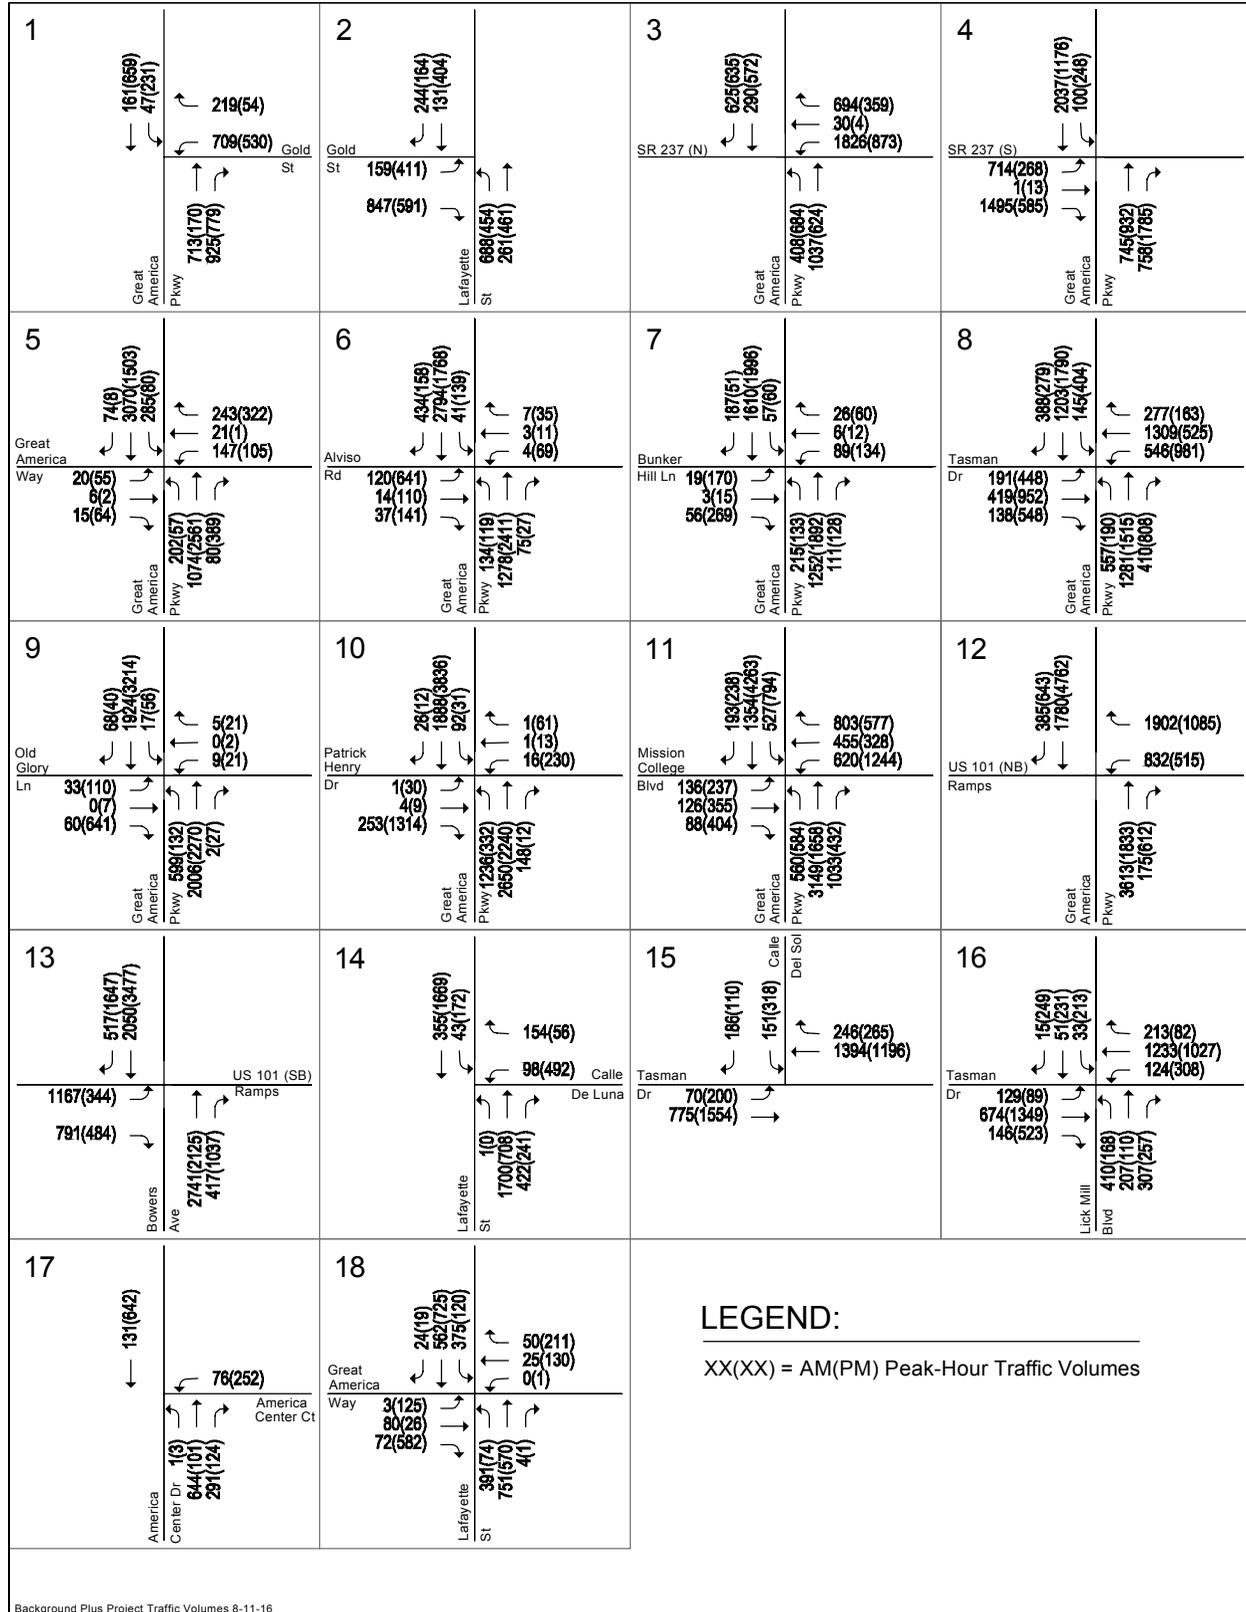

The net project trips were added to background traffic volumes to obtain background plus project traffic volumes. The background plus project traffic volumes at the study intersections are shown graphically on Figure 12. Traffic volumes for all components of traffic are tabulated in Appendix C.

**Table 8  
Background Plus Project Trip Generation Estimates**

Land Use	Size	Daily		AM Peak-Hour						PM Peak-Hour						
		Rate	Trip	PK-Hr Rate	Split		Trip		PK-Hr Rate	Split		Trip				
				Rate	In	Out	In	Out	Total	Rate	In	Out	In	Out	Total	
<b>Proposed Land Use</b>																
General Office Building (ITE Land Use Code 710) <sup>1</sup>	216,350 s.f.	11.03	2,386	1.56	88%	12%	297	41	338	1.49	17%	83%	55	267	322

**Figure 12**  
**Background Plus Project Traffic Volumes**

## Intersection LOS Under Background Plus Project Conditions

The results of the intersection level of service analysis under background plus project conditions are summarized in Table 9. The results show that, measured against the applicable municipal and CMP level of service standards, the following five intersections are projected to operate at an unacceptable LOS during at least one hour under background plus project conditions.

### *City of San Jose Study Intersections*

2. Lafayette Street and Gold Street Connector (AM Peak Hour) **Impact**
3. Great America Parkway and SR 237 (N)\* (AM Peak Hour)

### *City of Santa Clara Study Intersections*

6. Great America Parkway and Alviso Road (AM & PM Peak Hours)
11. Great America Parkway and Mission College Boulevard\* (PM Peak Hour)
16. Lick Mill Boulevard and Tasman Drive (PM Peak Hour)

\* Denotes CMP Intersection

Based on applicable municipal and CMP significance criteria, one of the above-identified intersections would be significantly impacted by the project. The impacts and proposed improvements to mitigate the impacts are described below.

All other study intersections are projected to operate at acceptable levels during both the AM and PM peak hours of traffic when measured against the applicable municipal and CMP level of service standards. The intersection level of service calculation sheets are included in Appendix D.

## Freeway Segment Level of Service Analysis

Traffic volumes on the study freeway segments under background plus project conditions were estimated by adding project trips to the existing volumes obtained from the 2014 CMP Annual Monitoring Report. The results of the freeway segment analysis under background plus project conditions are summarized in Table 10. The results show that mixed-flow lanes on seven of the 12 directional freeway segments analyzed would operate at unacceptable LOS F conditions during at least one peak hour. In addition, the HOV lanes on one of the study segments are projected to operate at LOS F conditions. Based on the CMP freeway segment criteria, the project would have a significant impact on mixed-flow lanes on four directional freeway segments and HOV lanes on one directional freeway segments during at least one peak hour.

### *Mixed-Flow Lane Segment Unacceptable LOS F:*

1. Eastbound SR 237 between N. Fair Oaks Avenue and Lawrence Expressway (PM Peak Hour)
2. Eastbound SR 237 between Lawrence Expressway and Great America Parkway (PM Peak Hour)
3. Eastbound SR 237 between Great America Parkway and North First Street (PM Peak Hour) **Impact**
4. Eastbound SR 237 between North First Street and Zanker Road (PM Peak Hour) **Impact**
6. Eastbound SR 237 between McCarthy Boulevard and I-880 (PM Peak Hour)
7. Westbound SR 237 between I-880 and McCarthy Boulevard (AM Peak Hour) **Impact**
8. Westbound SR 237 between McCarthy Boulevard and Zanker Road (AM & PM Peak Hours) **Impact**

### *HOV Lane Segment Unacceptable LOS F:*

7. Westbound SR 237 between I-880 and McCarthy Boulevard (AM Peak Hour) **Impact**

\* Denotes CMP Intersections  
 Entries denoted in **bold** indicate conditions that exceed the applicable level of service standard.  
**Bold** and boxed indicate significant project impact.

Full mitigation of significant project impacts on freeway segments would require roadway widening to construct additional through lanes, thereby increasing freeway capacity. Since it is not feasible for an individual development project to bear responsibility for implementing such extensive transportation system improvements due to constraints in acquisition and cost of right-of-way, and no comprehensive project to add through lanes has been developed by Caltrans or VTA for individual projects to contribute to, the significant impacts on the directional freeway segments identified above must be considered significant and unavoidable.

## Project Impacts and Mitigation Measures

This section discusses the project impacts identified under background plus project conditions. Included are descriptions of project impacts to intersections and proposed mitigation measures.

### (2) Lafayette Street and Gold Street Connector (City of San Jose)

**Impact:** This intersection would operate at LOS F during the AM peak hour under background conditions, and the added trips as a result of the proposed project would cause the intersection’s critical-movement delay to increase by four or more seconds and the demand-to-capacity ratio (V/C) to increase by 0.01 or more during the AM peak hour.

<sup>1</sup> Source: Santa Clara Valley Transportation Authority Congestion Management Program Monitoring Study, 2014.  
 Bold indicates unacceptable LOS.  
 Boxed indicates significant impact.

This constitutes a significant impact based on City of San Jose level of service impact criteria.

**Mitigation Measure.** This intersection's level of service could be improved with the addition of a second northbound left-turn lane. The improvement would reduce the average delay for vehicular traffic to an acceptable LOS D during the AM peak hour. The improvement will require widening of the Gold Street Connector and shifting of travel lanes to the south by approximately 12 feet to accommodate a second receiving lane for the second northbound left-turn lane. The roadway widening also will require the relocation of the park trail, south of the Gold Street Connector. The addition of a second northbound left-turn lane at the intersection also was identified as a mitigation measure for the approved City Place development in the City of Santa Clara. Traffic associated with the City Place development is included within background conditions of this study. However, the City of San Jose has no authority of development within other jurisdictions or their development schedules. Therefore, the project will be required to construct the improvements.

## 6. Cumulative Conditions

---

This chapter presents a summary of the traffic conditions that would occur under cumulative conditions. Cumulative development typically includes projects that are in the pipeline (pending projects) but are not yet approved. It includes descriptions of nearby pending developments and the procedure used to estimate traffic volumes associated with them. Cumulative conditions reflect traffic conditions that would occur at the time that the proposed project is completed. The analysis of cumulative conditions is required by the CMP and in conformance with the California Environmental Quality Act CEQA.

### Significant Impact Criteria

A significant cumulative traffic impact at an intersection is identified by comparing cumulative with project traffic conditions against background traffic conditions for City of San Jose study intersections. For City of Santa Clara study intersections, cumulative with project conditions are compared against cumulative no project conditions.

#### *City of San Jose Definition of Significant Intersection Impacts*

The cumulative projects collectively would create a significant adverse impact on traffic conditions at a signalized intersection in the City of San Jose if during either the AM or PM peak hour:

1. The level of service at the intersection degrades from an acceptable LOS D or better under background conditions to an unacceptable LOS E or F under cumulative conditions, or
2. The level of service at the intersection is an unacceptable LOS E or F under background conditions and the addition of cumulative project trips causes both the critical-movement delay at the intersection to increase by four (4) or more seconds and the volume-to-capacity ratio (V/C) to increase by 0.01 or more.

An exception to criteria 2 applies when the addition of project traffic reduces the amount of average stopped delay for critical movements (i.e., the change in average stopped delay for critical movements is negative). In this case, the threshold of significance is an increase in the critical V/C value by .01 or more.

A significant impact by City of San Jose standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to background conditions.

#### *Project Contribution to Cumulative Impacts*

A single project's contribution to a cumulative intersection impact is deemed considerable in the City of San Jose if the proportion of project traffic represents 25 percent or more of the increase in total volume from background traffic conditions to cumulative traffic conditions.

### ***City of Santa Clara Definition of Significant Intersection Impacts***

The project is said to create a significant adverse impact on traffic conditions at a signalized intersection in the City Santa Clara if for either peak hour:

1. The level of service at the intersection degrades from an acceptable level (LOS D or better at all city-controlled intersections and LOS E or better at all expressway intersections) under cumulative no project conditions to an unacceptable level (LOS E or F at city-controlled intersections and LOS F at expressway intersections) under cumulative conditions, or
2. The level of service at the intersection is an unacceptable level (LOS E or F at city-controlled intersections and LOS F at expressway intersections) under cumulative no project conditions and the addition of project trips causes the average critical delay to increase by four (4) or more seconds *and* the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

An exception to this rule applies when the addition of project traffic reduces the amount of average stopped delay for critical movements (i.e., the change in average stopped delay for critical movements is negative). In this case, the threshold of significance is an increase in the critical V/C value by .01 or more.

A significant impact by City of Santa Clara standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to an acceptable level or no worse than cumulative no project conditions.

### ***Conformance with CMP Standard***

Based on CMP criteria, a project would fail to meet the CMP or County Expressway intersection standard if the additional project traffic caused one of the following during either peak hour:

1. The level of service at the intersection degrades from an acceptable LOS E or better under background conditions to an unacceptable LOS F under cumulative conditions, or
2. The level of service at the intersection is an unacceptable LOS F under background conditions and the addition of pending project trips causes both the critical-movement delay at the intersection to increase by four (4) or more seconds *and* the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

An exception to this rule applies when the addition of project traffic reduces the amount of average delay for critical movements (i.e. the change in average delay for critical movements is negative). In this case, the threshold of significance is an increase in the critical V/C value by .01 or more.

A significant impact by CMP standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to cumulative no project conditions or better.

## **Transportation Network under Cumulative Conditions**

The intersection lane configurations under cumulative no project and cumulative with project conditions were assumed to be the same as described under background and background plus project conditions, respectively.

## **Cumulative Traffic Volumes**

Traffic volumes under cumulative conditions were estimated by adding the trips from approved developments, estimated project trips, and trips from proposed but not yet approved (pending) development projects. Cumulative conditions include trips generated by the following major pending development projects in the immediate area of the proposed project as summarized in Table 11.

**Table 11  
Pending Projects**

Applicant/Owner/Project Name	Address/Location	Proposed Project Description
North San Jose Phase II	North San Jose	8,000 residential units, 6.675 msf of office space, 425,000 s.f. of retail/commercial
237 Industrial Center Development	Ranch Drive, San Jose	1,197,000 s.f. of light industrial space
Top Golf	4701 North First Street, San Jose	a restaurant with a 200-room hotel and 110,000 s.f. of retail space and golf driving ranges
Ray Hashimoto /HMH for River of Life Church	1177 Laurelwood Road	New 35K sanctuary structure adjacent to existing building
Washington Holdings/Kelly Snyder	2041 Mission College Boulevard	build 5 new retail buildings totaling 24,000 sq. ft., a 5-story 175-room hotel
Scott Menard	3305 Kifer Road	48 attached townhomes and stacked flats with 109 parking spaces
Irvine Company	575 Benton Street	5-story mixed use project consisting ground floor 25,942 sf commercial space and 417 apartments
Summerhill	2230 El Camino Real	164 apartment units
Pinn Bros	1890 El Camino Real	four story mixed use development consisting of 60 for sale units, 5,820 sq. ft. of commercial
Johnathon Fearn/Summerhill Homes	3505 Kifer Road	996 residential units with 37,000 square foot retail
Irvine	3265 Scott Boulevard	2,000 rental housing units 40,000 sf retail added
Lour Mariani	2570 El Camino Real	1.5 acre site w/315 dwelling units
Menlo Equities	3535 Garrett	eight story office and three level parking
Rashik Patel T2	2950 Lakeside Drive	New 7 story hotel with 188 rooms
Xeres Dupont Fabros	555 Reed Street	111,000 sf data center
Jeff Guinta	2580 Lafayette	Adult gymnasium
Lennar Commercial	3607 Kifer Road	5-level parking structure, 5-story 199,460 sq.ft. office building
MCA	3265 Scott Boulevard	Expansion of activities at Muslim Community Association to include new high school
Bixby Lane Office	Tasman Drive and Old Ironside Drive	150,000 s.f. of office building
Great America Master Plan	Great America	59,050 s.f. of restaurant, 22,250 s.f. of bowling alley, 8,700 s.f. of retail, 25,500 s.f. theater, and 24,500 s.f. even center

\* Denotes CMP Intersections  
 Entries denoted in **bold** indicate conditions that exceeded the applicable level of service standard.  
**Bold** and boxed indicate significant project impact.

cumulative project trips collectively would create a significant adverse traffic impact at the following two intersections located in the City of San Jose during at least one peak hour:

2. Lafayette Street and Gold Street Connector (AM Peak Hour) **Impact**
3. Great America Parkway and SR 237 (N)\* (AM Peak Hour) **Impact**

\* Denotes CMP Intersection

The project’s contribution to the increase in total volume from background traffic conditions to cumulative traffic conditions at both of the intersections above would be 25 percent or more and are deemed considerable based on City of San Jose criteria.

The addition of cumulative project trips at the remaining City of San Jose study intersections would not create a significant adverse traffic impact when measured against the City of San Jose level of service standard. The intersection level of service calculation sheets are included in Appendix D.

### City of Santa Clara Intersections

The intersection level of service results for intersections located within the City of Santa Clara under cumulative conditions are summarized in Table 12. The results show that, measured against applicable municipal and CMP level of service level of service standards, the following four intersections would operate at unacceptable levels under cumulative conditions.

6. Great America Parkway and Alviso Road (AM & PM Peak Hours)
8. Great America Parkway and Tasman Drive\* (PM Peak Hour)
11. Great America Parkway and Mission College Boulevard\* (PM Peak Hour)

## 16. Lick Mill Boulevard and Tasman Drive (PM Peak Hour)

\* Denotes CMP Intersection

Based on the City of Santa Clara cumulative significance criteria, none of the above intersections would be significantly impacted by the project traffic.

## Cumulative Impacts and Mitigation Measures

Described below are the possible intersection improvements for the cumulatively significant intersection impacts to which the project's contribution is deemed considerable.

### ***(2) Lafayette Street and Gold Street Connector (City of San Jose)***

**Impact:** This intersection would operate at LOS F during the AM peak hour under background conditions, and the added trips as a result of the proposed and pending projects would cause the intersection's critical-movement delay to increase by four or more seconds and the demand-to-capacity ratio (V/C) to increase by 0.01 or more during the AM peak hour. The proposed project's contribution to traffic growth at this intersection would be 25 percent or more during the AM peak hour. The project's contribution to the cumulative significant impact is deemed considerable based on City of San Jose level of service impact criteria.

Mitigation Measure. This intersection's level of service could be improved with the addition of a second northbound left-turn lane. The improvement would reduce the average delay for vehicular traffic to an acceptable LOS D during the AM peak hour. The improvement will require widening of the Gold Street Connector and shifting of travel lanes to the south by approximately 12 feet to accommodate a second receiving lane for the second northbound left-turn lane. The roadway widening also will require the relocation of the park trail, south of the Gold Street Connector. The addition of a second northbound left-turn lane at the intersection also was identified as a mitigation measure for the approved City Place development in the City of Santa Clara. Traffic associated with the City Place development is included within background conditions of this study. However, the City of San Jose has no authority of development within other jurisdictions or their development schedules. Therefore, the project will be required to construct the improvements which also were identified to mitigate its project-level impacts.

### ***(3) Great America Parkway and SR 237 (North) (City of San Jose)***

**Impact:** This intersection would operate at LOS E during the AM peak hour under background conditions, and the added trips as a result of the proposed and pending projects would cause the intersection's critical-movement delay to increase by four or more seconds and the demand-to-capacity ratio (V/C) to increase by 0.01 or more during the AM peak hour. The proposed project's contribution to traffic growth at this intersection would be 25 percent or more during the AM peak hour. The project's contribution to the cumulative significant impact is deemed considerable based on City of San Jose level of service impact criteria.

Mitigation Measure. This intersection's level of service could be improved by adding a third left-turn lane and second right-turn lane to the intersections westbound approach (SR 237 off-ramp). This improvement would reduce the average delay for vehicular traffic to an acceptable LOS D during the AM peak hour. The improvement was an identified mitigation measure for the approved City Place development in the City of Santa Clara. Traffic associated with the City Place development is included within background conditions of this study.

## 7. Other Transportation Issues

---

This chapter presents an analysis of other transportation issues associated with the project site, including:

- Intersection operations analysis
- Intersection Signal Warrant Analysis
- Freeway Ramp Queuing Analysis
- Site access and traffic operations under project conditions
- Parking Analysis
- Potential impacts to transit, bicycle, and pedestrian facilities

These other transportation issues were evaluated to determine if any deficiencies would exist under project conditions that may not be specifically linked to environmental impact reporting. These may not be considered environmental issues, and may not be evaluated in an environmental assessment, but have been included in the traffic study to meet the requirements of the local jurisdiction. Unlike the level of service impact methodology, which is adopted by the City Council, the analyses in this chapter are based on professional judgment in accordance with the standards and methods employed by the traffic engineering community.

### Intersection Operational Analysis

The operations analysis is based on vehicle queuing for high demand turning movements at intersections. Vehicle queues were estimated using a Poisson probability distribution, which estimates the probability of “n” vehicles for a vehicle movement using the following formula:

$$P(x=n) = \frac{\lambda^n e^{-\lambda}}{n!}$$

Where:

P(x=n) = probability of “n” vehicles in queue per lane

n = number of vehicles in the queue per lane

$\lambda$  = average number of vehicles in the queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95<sup>th</sup> percentile maximum number of queued vehicles per cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement. This analysis thus provides a basis for estimating future left-turn

storage requirements at intersections. The 95<sup>th</sup> percentile queue length value indicates that during the peak hour, a queue of this length or less would occur on 95 percent of the signal cycles. Likewise, a queue length larger than the 95<sup>th</sup> percentile queue would only occur on 5 percent of the signal cycles (about 3 cycles during the peak hour for a signal with a 60-second cycle length). Therefore, left-turn storage pocket designs based on the 95<sup>th</sup> percentile queue length would ensure that storage space would be exceeded only 5 percent of the time. The 95<sup>th</sup> percentile queue length is also known as the “design queue length”. The vehicle queue estimates and a tabulated summary of the findings are provided in Table 13. The vehicular queuing analysis (Poisson probability calculations) is included in Appendix E.

### ***Great America Parkway and Gold Street Connector***

The queuing analysis indicates that the maximum vehicle queues for the southbound left-turn pocket at the Great America Parkway and Gold Street Connector intersection would exceed the existing vehicle storage capacity under existing plus project, background and background plus project conditions.

The southbound left-turn lane currently provides approximately 100 feet of vehicle storage, which can accommodate approximately four vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the southbound left-turn movement is projected to be approximately seven vehicles during the PM peak hour under background conditions. The addition of project traffic would lengthen the projected vehicle queue by no more than two vehicles during the PM peak hour. The southbound left-turn pocket already extends to the upstream intersection (America Center Drive and America Center Court). Thus, it is not possible to extend the left-turn pocket to meet the projected queue.

### ***Lafayette Street and Gold Street Connector***

The queuing analysis indicates that the maximum vehicle queues for the northbound left-turn pocket at the Lafayette Street and Gold Street Connector intersection would exceed the existing vehicle storage capacity under background and background plus project conditions.

The northbound left-turn lane currently provides approximately 350 feet of vehicle storage, which can accommodate approximately 14 vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the northbound left-turn movement is projected to be approximately 17 vehicles during the PM peak hour under background conditions. The addition of project traffic would lengthen the projected vehicle queue by no more than one vehicle during the PM peak hour. The left-turn pocket already extends to the upstream intersection (Lafayette Street and Great America Way). Thus, it is not possible to extend the left-turn pocket to meet the projected queue. However, a second northbound left-turn lane as proposed at the intersection to mitigate level of service impacts would provide adequate storage to serve the projected queue.

### ***Great America Parkway and SR 237 (South)***

#### **Southbound Left-Turn**

The queuing analysis indicates that the maximum vehicle queues for the southbound left-turn pocket at the Great America Parkway and SR 237 (South) intersection would exceed the existing vehicle storage capacity under background plus project conditions during the PM peak hour.

The southbound left-turn lane currently provides approximately 200 feet of vehicle storage, which can accommodate approximately eight vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the southbound left-turn movement is projected to be approximately nine vehicles during the PM peak hour under background plus project conditions. The southbound left-turn pocket already extends to the upstream intersection, Great America Parkway and SR 237 (North). Thus, it is not possible to extend the left-turn pocket to meet the projected queue. However, a maximum left-turn pocket storage inadequacy of only one vehicle is a worst-case traffic condition and is not likely to result in any operational problems at this intersection.

<sup>1</sup> Vehicle queue calculations based on cycle length for signalized intersections.  
<sup>2</sup> Assumes 25 feet per vehicle queued  
SBL = southbound left; NBL = northbound left, EBL = eastbound left, WBR = westbound right

### **Eastbound Left-Turn**

The queuing analysis indicates that the maximum vehicle queues for the eastbound left-turn pocket at the Great America Parkway and SR 237 (South) intersection would exceed the existing vehicle storage capacity under background and background plus project conditions.

The eastbound left-turn lane currently provides approximately 300 feet of vehicle storage, which can accommodate approximately 12 vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the eastbound left-turn movement is projected to be approximately 21 vehicles during the AM peak hour under background conditions. The addition of project traffic would lengthen the projected vehicle queue by no more than one vehicle during the AM peak hour. The eastbound left-turn pocket could potentially be extended to provide an additional 225 feet of storage.

## **Signal Warrant Analysis**

The need for signalization of an unsignalized intersection is assessed based on the Peak Hour Volume Warrant (Warrant 3) described in the *California Manual on Uniform Traffic Control Devices for Streets and Highways (CA MUTCD)*, Part 4, Highway Traffic Signals, 2010. This method makes no evaluation of intersection level of service, but simply provides an indication whether vehicular peak hour traffic volumes are, or would be, sufficient to justify installation of a traffic signal. Intersections that meet the peak hour warrant are subject to further analysis before determining that a traffic signal is necessary. Additional analysis may include unsignalized level of service analysis and/or operational analysis such as evaluating vehicle queuing and delay. Other options such as traffic control devices, signage, or geometric changes may be preferable based on existing field conditions. The traffic signal warrant calculations are included in Appendix E.

### ***Lafayette Street and Great America Way (Santa Clara)***

Peak-hour traffic signal warrant checks indicate that the traffic volumes at the Lafayette Street and Great America Way intersection during the PM peak hour are projected to meet thresholds that warrant signalization under background and background with project conditions.

Traffic volumes indicate that the signalization of the Lafayette Street and Great America Way intersection is not necessary until the construction of other approved development in the project area, which includes the City Place development, is completed. The installation of a signal at the intersection was also identified to be warranted with the City Place development. The proposed project will result in a total of 58 PM peak hour trips through the intersection. Because signalization of an intersection is dependent upon many factors and may be required regardless of the proposed project, the City of Santa Clara will decide when and if a signal should be installed and provide funding for its construction. Therefore, the proposed project would not result in a significant impact at the Lafayette Street and Great America Way intersection.

## **Freeway Ramp Analysis**

An analysis of metered freeway ramps providing access to the project site was performed to identify the effect of the addition of project traffic on the queues at metered study freeway on-ramps. It should be noted that the evaluation of freeway ramps is not required based on the City's transportation impact analysis guidelines. Nor are there adopted methodologies and impact criteria for the analysis of freeway ramps.

It is projected that the project will result in the addition of peak hour trips to two freeway interchanges: (1) US 101 at Great America Parkway/Bowers Avenue, (2) and SR 237 at Great America Parkway. The metered freeway on-ramps were evaluated during the PM peak hour of traffic only since the majority of the proposed project traffic that is projected to be added to freeway on-ramps will occur during the PM

peak hour. Both the westbound and eastbound on-ramps at SR 237 interchange are metered during the PM peak hour. However, only the southbound loop on-ramp at the US 101 interchange is metered during the PM peak hour.

The existing queue lengths and service rates of the meters at the ramps were measured in the field during the PM peak hour. Wait times (the time it took a vehicle at the end of the queue to proceed through the meter) at each metered ramp were derived from the collected data. A ratio between the existing volumes using the freeway on-ramps and the approved and project trips was used to estimate the number of vehicles that would be added to the existing queue under background and project conditions.

Based on the freeway ramp analysis, the proposed project traffic will have minimal effect on delay and queues at the southbound on-ramp at the US 101/Bowers Avenue and westbound on-ramp at the SR 237/Great America Parkway interchanges. The addition of project traffic to each of the ramps will equate to a less than 3.0% increase in volume and would extend the wait times by no more than six seconds during the PM peak hour. In addition, the addition of project traffic would result in the extension of projected queues at each ramp by no more than one vehicle.

### ***SR 237 Eastbound On-Ramp from Great America Parkway***

The addition of project traffic to the SR 237 eastbound diagonal on-ramp from Great America Parkway will equate to an approximately 54% increase in the southbound left-turn volume during the PM peak hour and would extend the wait times at the ramp by approximately 34 seconds.

The maximum queue lengths measured in the field and projected under project conditions would extend beyond the available storage on the on-ramp. The SR 237 eastbound diagonal on-ramp from Great America Parkway already provides one HOV lane and two mixed-flow lanes. The ramp overcrossing of Lafayette Street, located approximately 550 feet east of Great America Boulevard, restricts the addition of storage on the ramp. Therefore, additional physical improvement for the purpose of queue storage at the ramp would consist of widening Great America Parkway and possibly the SR 237 overcrossing.

The widening of Great America Parkway and addition of a southbound left-turn lane would provide additional queue storage. However, the additional southbound lane would not provide an operational benefit to ramp operations since the ramp operations are dictated by the ramp meter rate. There will be no reduction in projected queues without an adjustment of the ramp meter rate to increase the number of vehicles being fed onto the freeway. The City has worked cooperatively with VTA and Caltrans to implement measures to minimize the effects of vehicular queues at freeway ramps, such as shutting off the ramp meters when vehicular queues extend back onto the arterials. The City will continue to monitor the effects of traffic growth in the area and its effects on freeway ramp operations and work with VTA and Caltrans to implement further measures when deemed necessary.

The freeway ramp analysis is summarized in Table 14. Calculation of the ramp queue lengths and wait time under background and project conditions are presented in Appendix E.

## **Site Access**

The proposed Building 5 will be located at the southeast corner of the America Center office campus. Nearly all of the planned on-site roadways that will serve the campus, including the proposed Building 5, are completed. Access to the proposed Building 5 would be taken from the existing on-site roadways of America Center Drive and America Center Court. The project does not involve changes to the existing site access and circulation.

The campus, including the proposed Building 5, will be served by a 1,870 space-parking garage located along the southern and eastern boundaries of the site. The garage is currently under construction. Access to the parking garage will be provided by two driveways along America Center Court. A driveway will also be located at the north end of the garage and accessed from America Center Drive.

**Table 14  
Freeway Ramp Analysis**

Ramp	Count Date	Peak Hour	Existing Conditions <sup>1</sup>			Background Conditions <sup>2</sup>			Project Conditions <sup>2</sup>				
			Volume	Queue Length (veh.)	Wait Time/c/ (min:sec)	Approved Trips	Queue Length (veh.)	Wait Time <sup>3</sup> (min:sec)	Project Trips	% Increase <sup>4</sup>	Queue Length (veh.)	Wait Time <sup>3</sup> (min:sec)	Increase (min:sec)
US 101 SB Loop On-Ramp from Great America Parkway	06/22/16	PM	650	16	01:04.0	970	40	02:40.0	27	1.67%	41	02:44.0	00:04.0
SR 237 EB On-Ramp from Great America Parkway <sup>5</sup>	06/23/16	PM	58	83	09:16.0	103	88	09:49.0	87	54.04%	93	10:23.0	00:34.0
SR 237 WB On-Ramp from Great America Parkway	05/25/16	PM	516	15	01:30.0	772	37	03:42.0	35	2.72%	38	03:48.0	00:06.0

Notes:

<sup>1</sup>Existing queue length represents the longest queue observed during the peak-hour period.

<sup>2</sup>Background and project conditions queue lengths were estimated based on the ratio between the existing volumes on the ramp and the estimated approved and project trips added to the ramp, respectively.

<sup>3</sup>Future wait times were estimated based on the queue length and the measured meter's service rate.

<sup>4</sup>Percent increase was calculated from background to project conditions.

<sup>5</sup>A Maximum queues of 80 and 3 vehicles were measured on the eastbound on-ramp for the mixed-flow lanes and the southbound left-turn lane, respectively.

America Center Court intersects with America Center Drive just north of the Gold Street Connector. America Center Court is 36 feet wide between America Center Drive and the point at which it changes to a north/south alignment. The roadway narrows to a 26 feet wide travel way along its north/south alignment. The results of the peak-hour traffic signal warrant checks at the America Center Drive and America Center Court intersection indicate that the projected traffic volumes under project conditions will not meet thresholds that warrant signalization.

## Parking Analysis

Per the City of San Jose Municipal Code (Chapter 20.90.060), office land uses are required to provide one space per 300 sf of building space. Based on the City's parking requirements, a total of 3,614 off-street parking spaces are required for the 1,084,112<sup>2</sup> sf of office space (867,762 sf of existing/planned plus proposed 216,350 sf) on the entire campus. The project proposes a total of 3,610 on-site parking spaces (1,870 parking spaces within the planned parking garage and 1,740 spaces within surface parking lots). The surface parking areas should be configured to provide the additional four spaces to meet the City's parking requirements if Building 5 is proposed to utilize all the square footage that is included as part of the rezoning.

### *Bicycle Parking*

The City's Bicycle Parking requirements require one bicycle parking space per 4,000 square feet of office floor area. The proposed project is required to provide 271 bicycle parking spaces to meet the city standards. It is recommended that the project provide bicycle parking that exceeds the City requirements to encourage the use of non-auto modes of travel and minimize the demand for on-site parking described above.

## Transit Services

The project site is not directly served by any transit services other than the ACE Shuttle that has a stop within the America Center development. The ACE Green Shuttle (823) operates on Tasman Drive and Great America Parkway between its route from the Great America ACE Station and the America Center campus. There are scheduled stops at the Convention Center and Old Ironsides LRT Stations along Tasman Drive, which also provides connections to other VTA bus lines. The nearest bus stops are located along Gold Street near its intersection with Taylor Street that is located approximately one mile from the project site and at the intersection of Tasman Drive and Old Ironsides Drive located approximately 1.5 miles from the project site. The nearest LRT station is also located at the intersection of Tasman Drive and Old Ironsides Drive.

It is assumed that only a minimal number of employees of the proposed office development would utilize existing transit services due the long walking distance and lack of pedestrian facilities linking the project site to transit facilities. In addition, the ACE shuttle provides only four scheduled runs during the morning and evening commute hours. It is recommended that the project pursue implementation of employee shuttles to provide a link between the project site and transit services (LRT station and bus stops) near the Old Ironsides and Tasman Drive intersection and Great America ACE Station. Should shuttle buses be implemented, the highest transit mode-share that could be expected for the project would be an estimated three percent, which equates to approximately 8 to 9 new transit riders during the peak hours. Assuming the existing transit service would remain unchanged, with five bus lines and the Mountain View-Alum Rock LRT line providing service near the project site, the new riders due to the proposed project can be accommodated by the current available capacity of the transit service in the study area.

---

<sup>2</sup> The 6,000 sf of proposed amenity space is not counted toward parking requirements as it would serve the proposed use and is not anticipated to generate additional vehicle trips.

An evaluation of the effects of project traffic on transit vehicle delay also was completed. The analysis was completed for all transit routes that travel through the study intersections utilizing information produced by the intersection Level of Service analysis. The results of the transit delay analysis is presented in Table 15. The analysis shows that the traffic associated with the proposed project would increase delay to transit vehicles by less than 15 seconds per vehicle during the peak hours. The VTA has not established policies or significance criteria related to transit vehicle delay. Thus, this data is presented for informational purposes only.

**Table 15  
Transit Delay Analysis Summary**

Route #	Study Area Street(s)	Direction	Projected Increase in Transit Vehicle Delay (sec/veh)	
			AM	PM
57	Great America Pkwy	NB	4.8	-0.3
		SB	-0.1	14.4
60	Great America Pkwy, Mission College Blvd	NB	0.1	0.0
		SB	0.0	6.8
321	Great America Pkwy, Mission College Blvd	NB	0.1	3.0
		SB	-0.1	0.0
330	Great America Pkwy, Mission College Blvd	NB	-0.1	6.5
		SB	0.3	0.6
140	Great America Pkwy, Mission College Blvd	NB	-0.1	6.5
		SB	0.3	0.6

Notes:  
Projected increase in transit delay based on a comparison of background vs. background plus project conditions intersection movement delays calculated by TRAFFIX.

## Bicycle and Pedestrian Facilities

There are several bike lanes and bike paths in the vicinity of the project site. In addition, the San Jose Bike Plan 2020 and Envision 2040 General Plan identifies planned improvements to the bicycle network within the City and provides policies and goals that are intended to promote and encourage the use of multi-modal travel options and reduce the identified project impacts to the roadway system. The planned improvements to the bicycle network will provide the project site with improved connections to surrounding pedestrian/bike and transit facilities and a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies. In the immediate area of the project, a Class I off-street trail is planned to run generally around the perimeter of the America Center Campus with connections to the Baylands Park Trail near the Lafayette Street/Gold Street Connector intersection and San Tomas Aquino Creek. An additional connection to the Bay Trail is proposed as part of the Residence Inn project at the northern termination of America Center Court.

Pedestrian facilities in the immediate project area are limited. In particular, there are no sidewalks provided along America Center Court, the east side of America Center Drive along the Building 5 frontage, and either side of America Center Drive between the Gold Street Connector and the Building 5 frontage which are all private street segments. Sidewalks are provided along both sides of America Center Drive north of the Building 5 frontage. There is an unpaved walkway provided along the west side of America Center Drive between the America Center office buildings and the Gold Street Connector.

It is unlikely that the proposed project will result in measurable increase of pedestrians given that the nearest commercial uses and transit services are located more than 1.5 miles from the project site. However, pedestrian traffic from the project site could include the recreational use of the Baylands Park Trail by employees that runs along the north side of SR 237. Access to the trail is provided at the SR 237 and Great America westbound ramps intersection. The intersection provides controlled crosswalks across Great America Parkway on its north approach and across the SR 237 westbound on-ramp. Use of the trail and crosswalks at the SR 237 and Great America westbound ramps intersection by pedestrians originating from the proposed Building 5 will require crossing America Center Drive. Given the lack of pedestrian facilities along the east side of Great America Parkway south of the project site, it is not recommended that sidewalks be provided along the Building 5 frontage. Instead, pedestrians should be directed with wayfaring signs to the use of the parking lot drive aisles and entrances along America Center Drive located between Buildings 1-2 and 3-5.

### ***Transportation Demand Management***

The project will establish single-occupant auto trip reduction measures, via a travel demand management (TDM) program, that result in the reduction of vehicular trips to the project site and reduce the demand for on-site parking discussed above. The TDM program should encourage multimodal travel and use of the extensive transit services and pedestrian/bicycle facilities in the North San Jose area to the maximum extent possible. The applicant/property owner should manage the TDM program to ensure tenant employee participation. An effective TDM program that includes several of the measures identified below can easily achieve a 25% percent reduction in work-related vehicle trips that result in a reduction in trips generated by the project and parking demand. However, the analysis contained in this report does not include reductions based on TDM measures. Therefore, the estimates of trips to be generated by the proposed project as presented and evaluated within this study may represent an over-estimation of traffic and impacts associated with the proposed project. The project TDM program could include, but would not be limited to, the following elements to reduce vehicle trips:

- *Eco Pass or Clipper Card* for all employees, providing free rides on Santa Clara County's local transit agency, the Santa Clara Valley Transportation Authority (VTA)
- *25% Transit Subsidy* for transit agencies other than the VTA, including Caltrain, ACE, Capitol Corridor, BART, MUNI, and other
- *Monthly Vanpool Subsidy*
- *Commuter Tax Benefits* through WageWorks offering pre-tax deduction per month for transit and pre-tax deduction per month for parking
- *Free "Last Mile" Shuttles* to local train systems (e.g. Caltrain, Amtrak, ACE)
- *Free WiFi Commuter Buses* direct from areas like San Francisco and the TriValley area
- *Internal Carpool Matching Program* utilizing zip code matching
- *Regional Carpool Matching Program* through 511
- *Personalized Commute Assistance* offered by a Commute Coordinator
- *Preferred parking for Carpools and Vanpools* located near entrances to every building
- *Bicycle Lockers and/or Bicycle Racks* near entrances to every building
- *Showers* for cyclists and pedestrians, offering clean towel service, complimentary toiletries, hair dryers, and ironing boards
- *Intranet Site* featuring transit, bike, ridesharing and telework information
- *New Hire Orientation* presentations focusing on commute alternatives from Day 1
- *Centrally-Located Kiosks* with transit schedules, bike and transit maps, and other commute alternative information
- *Periodic Events* which connect employees with local transit agencies and transportation organizations (e.g. Spare the Air Fair, Bike to Work Day)
- *Onsite amenities* which allow employees to complete errands without a car, such as bicycle repair, dry cleaning, oil changes, carwash, haircuts, dental services, cafeteria, coffee bars, fitness center, massage services, mail and shipping services, convenience store, ATM, gift store.

## 8. Conclusions

---

The potential impacts of the project were evaluated in accordance with the standards set forth by the City of San Jose and the Congestion Management Program (CMP) of Santa Clara County. The study included the analysis of AM and PM peak hour traffic conditions for fifteen signalized intersections and two unsignalized intersections. Project impacts on other transportation facilities, such as bicycle facilities and transit service, were determined on the basis of engineering judgment.

### Project Intersection Level of Service Analysis

The results of the level of service analysis show that, measured against the applicable municipal and CMP standards, all of the study intersections would operate at an acceptable LOS D or better under existing plus project conditions during both the AM and PM peak hours of traffic.

The results show that one intersection located within the City of San Jose would be significantly impacted by the project under background plus project conditions, according to applicable municipal and CMP impact criteria. The proposed improvements to mitigate the project impacts are described below.

#### ***(2) Lafayette Street and Gold Street Connector (City of San Jose)***

Mitigation Measure. This intersection's level of service could be improved with the addition of a second northbound left-turn lane. The improvement would reduce the average delay for vehicular traffic to an acceptable LOS D during the AM peak hour. The improvement will require widening of the Gold Street Connector and shifting of travel lanes to the south by approximately 12 feet to accommodate a second receiving lane for the second northbound left-turn lane. The roadway widening also will require the relocation of the park trail, south of the Gold Street Connector. The addition of a second northbound left-turn lane at the intersection also was identified as a mitigation measure for the approved City Place development in the City of Santa Clara. Traffic associated with the City Place development is included within background conditions of this study. However, the City of San Jose has no authority of development within other jurisdictions or their development schedules. Therefore, the project will be required to construct the improvements.

### Cumulative Intersection Level of Service Analysis

The results show that, two intersections in the City of San Jose would be significantly impacted by the project traffic based on applicable municipal cumulative significance criteria.

Described below are the possible intersection improvements for the cumulatively significant intersection impacts to which the project's contribution is deemed considerable.

## ***(2) Lafayette Street and Gold Street Connector (City of San Jose)***

**Mitigation Measure.** This intersection's level of service could be improved with the addition of a second northbound left-turn lane. The improvement would reduce the average delay for vehicular traffic to an acceptable LOS D during the AM peak hour. The improvement will require widening of the Gold Street Connector and shifting of travel lanes to the south by approximately 12 feet to accommodate a second receiving lane for the second northbound left-turn lane. The roadway widening also will require the relocation of the park trail, south of the Gold Street Connector. The addition of a second northbound left-turn lane at the intersection also was identified as a mitigation measure for the approved City Place development in the City of Santa Clara. Traffic associated with the City Place development is included within background conditions of this study. However, the City of San Jose has no authority of development within other jurisdictions or their development schedules. Therefore, the project will be required to construct the improvements which also were identified to mitigate its project-level impacts.

## ***(3) Great America Parkway and SR 237 (North) (City of San Jose)***

**Mitigation Measure.** This intersection's level of service could be improved by adding a third left-turn lane and second right-turn lane to the intersections westbound approach (SR 237 off-ramp). This improvement would reduce the average delay for vehicular traffic to an acceptable LOS D during the AM peak hour. The improvement was an identified mitigation measure for the approved City Place development in the City of Santa Clara. Traffic associated with the City Place development is included within background conditions of this study.

## **Freeway Segment Analysis**

The results of the freeway segment analysis show that, based on the CMP freeway segment criteria, the project would have a significant impact on mixed-flow lanes on four directional freeway segments and HOV lanes on one directional freeway segment during at least one peak hour.

Full mitigation of significant project impacts on freeway segments would require roadway widening to construct additional through lanes, thereby increasing freeway capacity. Since it is not feasible for an individual development project to bear responsibility for implementing such extensive transportation system improvements due to constraints in acquisition and cost of right-of-way, and no comprehensive project to add through lanes has been developed by Caltrans or VTA for individual projects to contribute to, the significant impacts on the directional freeway segments identified above must be considered significant and unavoidable.

## **Other Transportation Issues**

### ***Intersection Operations Analysis***

#### **Great America Parkway and Gold Street Connector**

The queuing analysis indicates that the maximum vehicle queues for the southbound left-turn pocket at the Great America Parkway and Gold Street Connector intersection would exceed the existing vehicle storage capacity under existing plus project, background and background plus project conditions.

The southbound left-turn lane currently provides approximately 100 feet of vehicle storage, which can accommodate approximately four vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the southbound left-turn movement is projected to be approximately seven vehicles during the PM peak hour under background conditions. The addition of project traffic would lengthen the projected vehicle queue by no more than two vehicles during the PM peak hour. The southbound left-turn pocket already extends

to the upstream intersection (America Center Drive and America Center Court). Thus, it is not possible to extend the left-turn pocket to meet the projected queue.

### **Lafayette Street and Gold Street Connector**

The queuing analysis indicates that the maximum vehicle queues for the northbound left-turn pocket at the Lafayette Street and Gold Street Connector intersection would exceed the existing vehicle storage capacity under background and background plus project conditions.

The northbound left-turn lane currently provides approximately 350 feet of vehicle storage, which can accommodate approximately 14 vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the northbound left-turn movement is projected to be approximately 17 vehicles during the PM peak hour under background conditions. The addition of project traffic would lengthen the projected vehicle queue by no more than one vehicle during the PM peak hour. The left-turn pocket already extends to the upstream intersection (Lafayette Street and Great America Way). Thus, it is not possible to extend the left-turn pocket to meet the projected queue. However, a second northbound left-turn lane as proposed at the intersection to mitigate level of service impacts would provide adequate storage to serve the projected queue.

### **Great America Parkway and SR 237 (South)**

#### **Southbound Left-Turn**

The queuing analysis indicates that the maximum vehicle queues for the southbound left-turn pocket at the Great America Parkway and SR 237 (South) intersection would exceed the existing vehicle storage capacity under background plus project conditions during the PM peak hour.

The southbound left-turn lane currently provides approximately 200 feet of vehicle storage, which can accommodate approximately eight vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the southbound left-turn movement is projected to be approximately nine vehicles during the PM peak hour under background plus project conditions. The southbound left-turn pocket already extends to the upstream intersection, Great America Parkway and SR 237 (North). Thus, it is not possible to extend the left-turn pocket to meet the projected queue. However, a maximum left-turn pocket storage inadequacy of only one vehicle is a worst-case traffic condition and is not likely to result in any operational problems at this intersection.

#### **Eastbound Left-Turn**

The queuing analysis indicates that the maximum vehicle queues for the eastbound left-turn pocket at the Great America Parkway and SR 237 (South) intersection would exceed the existing vehicle storage capacity under background and background plus project conditions.

The eastbound left-turn lane currently provides approximately 300 feet of vehicle storage, which can accommodate approximately 12 vehicles. The estimated 95<sup>th</sup> percentile vehicle queue for the eastbound left-turn movement is projected to be approximately 21 vehicles during the AM peak hour under background conditions. The addition of project traffic would lengthen the projected vehicle queue by no more than one vehicle during the AM peak hour. The eastbound left-turn pocket could potentially be extended to provide an additional 225 feet of storage.

## ***Signal Warrant Analysis***

### **Lafayette Street and Great America Way (City of Santa Clara)**

Peak-hour traffic signal warrant checks indicate that the traffic volumes at the Lafayette Street and Great America Way intersection during the PM peak hour are projected to meet thresholds that warrant signalization under background and background with project conditions.

Traffic volumes indicate that the signalization of the Lafayette Street and Great America Way intersection is not necessary until the construction of other approved development in the project area, which includes the City Place development, is completed. The installation of a signal at the intersection was also identified to be warranted with the City Place development. The proposed project will result in a total of 58 PM peak hour trips through the intersection. Because signalization of an intersection is dependent upon many factors and may be required regardless of the proposed project, the City of Santa Clara will decide when and if a signal should be installed and provide funding for its construction. Therefore, the proposed project would not result in a significant impact at the Lafayette Street and Great America Way intersection.

## ***Freeway Ramp Analysis***

An analysis of metered freeway ramps providing access to the project site was performed to identify the effect of the addition of project traffic on the queues at metered study freeway on-ramps. It should be noted that the evaluation of freeway ramps is not required based on the City's transportation impact analysis guidelines. Nor are there adopted methodologies and impact criteria for the analysis of freeway ramps.

It is projected that the project will result in the addition of peak hour trips to two freeway interchanges: (1) US 101 at Great America Parkway/Bowers Avenue, (2) and SR 237 at Great America Parkway. The metered freeway on-ramps were evaluated during the PM peak hour of traffic only since the majority of the proposed project traffic that is projected to be added to freeway on-ramps will occur during the PM peak hour. Both the westbound and eastbound on-ramps at SR 237 interchange are metered during the PM peak hour. However, only the southbound loop on-ramp at the US 101 interchange is metered during the PM peak hour.

Based on the freeway ramp analysis, the proposed project traffic will have minimal effect on delay and queues at the southbound on-ramp at the US 101/Bowers Avenue and westbound on-ramp at the SR 237/Great America Parkway interchanges. The addition of project traffic to each of the ramps will equate to a less than 3.0% increase in volume and would extend the wait times by no more than six seconds during the PM peak hour. In addition, the addition of project traffic would result in the extension of projected queues at each ramp by no more than one vehicle.

### **SR 237 Eastbound On-Ramp from Great America Parkway**

The addition of project traffic to the SR 237 eastbound diagonal on-ramp from Great America Parkway will equate to an approximately 54% increase in the southbound left-turn volume during the PM peak hour and would extend the wait times at the ramp by approximately 34 seconds.

The maximum queue lengths measured in the field and projected under project conditions would extend beyond the available storage on the on-ramp. The SR 237 eastbound diagonal on-ramp from Great America Parkway already provides one HOV lane and two mixed-flow lanes. The ramp overcrossing of Lafayette Street, located approximately 550 feet east of Great America Boulevard, restricts the addition of storage on the ramp. Therefore, additional physical improvement for the purpose of queue storage at the ramp would consist of widening Great America Parkway and possibly the SR 237 overcrossing.

The widening of Great America Parkway and addition of a southbound left-turn lane would provide additional queue storage. However, the additional southbound lane would not provide an operational benefit to ramp operations since the ramp operations are dictated by the ramp meter rate. There will be

no reduction in projected queues without an adjustment of the ramp meter rate to increase the number of vehicles being fed onto the freeway. The City has worked cooperatively with VTA and Caltrans to implement measures to minimize the effects of vehicular queues at freeway ramps, such as shutting off the ramp meters when vehicular queues extend back onto the arterials. The City will continue to monitor the effects of traffic growth in the area and its effects on freeway ramp operations and work with VTA and Caltrans to implement further measures when deemed necessary.

### **Site Access**

The proposed Building 5 will be located at the southeast corner of the America Center office campus. Nearly all of the planned on-site roadways that will serve the campus, including the proposed Building 5, are completed. Access to the proposed Building 5 would be taken from the existing on-site roadways of America Center Drive and America Center Court. The project does not involve changes to the existing site access and circulation.

The campus, including the proposed Building 5, will be served by a 1,870 space-parking garage located along the southern and eastern boundaries of the site. The garage is currently under construction. Access to the parking garage will be provided by two driveways along America Center Court. A driveway will also be located at the north end of the garage and accessed from America Center Drive.

America Center Court intersects with America Center Drive just north of the Gold Street Connector. America Center Court is 36 feet wide between America Center Drive and the point at which it changes to a north/south alignment. The roadway narrows to a 26 feet wide travel way along its north/south alignment. The results of the peak-hour traffic signal warrant checks at the America Center Drive and America Center Court intersection indicate that the projected traffic volumes under project conditions will not meet thresholds that warrant signalization.

### **Parking Analysis**

Per the City of San Jose Municipal Code (Chapter 20.90.060), office land uses are required to provide one space per 300 sf of building space. Based on the City's parking requirements, a total of 3,614 off-street parking spaces are required for the 1,084,112<sup>3</sup> sf of office space (867,762 sf of existing/planned plus proposed 216,350 sf) on the entire campus. The project proposes a total of 3,610 on-site parking spaces (1,870 parking spaces within the planned parking garage and 1,740 spaces within surface parking lots). The surface parking areas should be configured to provide the additional four spaces to meet the City's parking requirements if Building 5 is proposed to utilize all the square footage that is included as part of the rezoning.

### **Bicycle Parking**

The City's Bicycle Parking requirements require one bicycle parking space per 4,000 square feet of office floor area. The proposed project is required to provide 271 bicycle parking spaces to meet the city standards. It is recommended that the project provide bicycle parking that exceeds the City requirements to encourage the use of non-auto modes of travel and minimize the demand for on-site parking described above.

### **Transit Services**

The project site is not directly served by any transit services other than the ACE Shuttle that has a stop within the America Center development. The ACE Green Shuttle (823) operates on Tasman Drive and Great America Parkway between its route from the Great America ACE Station and the America Center campus. There are scheduled stops at the Convention Center and Old Ironsides LRT Stations along

---

<sup>3</sup> The 6,000 sf of proposed amenity space is not counted toward parking requirements as it would serve the proposed use and is not anticipated to generate additional vehicle trips.

Tasman Drive, which also provides connections to other VTA bus lines. The nearest bus stops are located along Gold Street near its intersection with Taylor Street that is located approximately one mile from the project site and at the intersection of Tasman Drive and Old Ironsides Drive located approximately 1.5 miles from the project site. The nearest LRT station is also located at the intersection of Tasman Drive and Old Ironsides Drive.

It is assumed that only a minimal number of employees of the proposed office development would utilize existing transit services due the long walking distance and lack of pedestrian facilities linking the project site to transit facilities. In addition, the ACE shuttle provides only four scheduled runs during the morning and evening commute hours. It is recommended that the project pursue implementation of employee shuttles to provide a link between the project site and transit services (LRT station and bus stops) near the Old Ironsides and Tasman Drive intersection and Great America ACE Station. Should shuttle buses be implemented, the highest transit mode-share that could be expected for the project would be an estimated three percent, which equates to approximately 8 to 9 new transit riders during the peak hours. Assuming the existing transit service would remain unchanged, with five bus lines and the Mountain View-Alum Rock LRT line providing service near the project site, the new riders due to the proposed project can be accommodated by the current available capacity of the transit service in the study area.

### ***Bicycle and Pedestrian Facilities***

There are several bike lanes and bike paths in the vicinity of the project site. In addition, the San Jose Bike Plan 2020 and Envision 2040 General Plan identifies planned improvements to the bicycle network within the City and provides policies and goals that are intended to promote and encourage the use of multi-modal travel options and reduce the identified project impacts to the roadway system. The planned improvements to the bicycle network will provide the project site with improved connections to surrounding pedestrian/bike and transit facilities and a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies. In the immediate area of the project, a Class I off-street trail is planned to run generally around the perimeter of the America Center Campus with connections to the Baylands Park Trail near the Lafayette Street/Gold Street Connector intersection and San Tomas Aquino Creek. An additional connection to the Bay Trail is proposed as part of the Residence Inn project at the northern termination of America Center Court.

Pedestrian facilities in the immediate project area are limited. In particular, there are no sidewalks provided along America Center Court, the east side of America Center Drive along the Building 5 frontage, and either side of America Center Drive between the Gold Street Connector and the Building 5 frontage which are all private street segments. Sidewalks are provided along both sides of America Center Drive north of the Building 5 frontage. There is an unpaved walkway provided along the west side of America Center Drive between the America Center office buildings and the Gold Street Connector.

It is unlikely that the proposed project will result in measurable increase of pedestrians given that the nearest commercial uses and transit services are located more than 1.5 miles from the project site. However, pedestrian traffic from the project site could include the recreational use of the Baylands Park Trail by employees that runs along the north side of SR 237. Access to the trail is provided at the SR 237 and Great America westbound ramps intersection. The intersection provides controlled crosswalks across Great America Parkway on its north approach and across the SR 237 westbound on-ramp. Use of the trail and crosswalks at the SR 237 and Great America westbound ramps intersection by pedestrians originating from the proposed Building 5 will require crossing America Center Drive. Given the lack of pedestrian facilities along the east side of Great America Parkway south of the project site, it is not recommended that sidewalks be provided along the Building 5 frontage. Instead, pedestrians should be directed with wayfinding signs to the use of the parking lot drive aisles and entrances along America Center Drive located between Buildings 1-2 and 3-5.

### ***Transportation Demand Management***

The project will establish single-occupant auto trip reduction measures, via a travel demand management (TDM) program, that result in the reduction of vehicular trips to the project site and reduce the demand for

on-site parking discussed above. The TDM program should encourage multimodal travel and use of the extensive transit services and pedestrian/bicycle facilities in the North San Jose area to the maximum extent possible. The applicant/property owner should manage the TDM program to ensure tenant employee participation. An effective TDM program that includes several of the measures identified below can easily achieve a 25% percent reduction in work-related vehicle trips that result in a reduction in trips generated by the project and parking demand. However, the analysis contained in this report does not include reductions based on TDM measures. Therefore, the estimates of trips to be generated by the proposed project as presented and evaluated within this study may represent an over-estimation of traffic and impacts associated with the proposed project. The project TDM program could include, but would not be limited to, the following elements to reduce vehicle trips:

- *Eco Pass or Clipper Card* for all employees, providing free rides on Santa Clara County's local transit agency, the Santa Clara Valley Transportation Authority (VTA)
- *25% Transit Subsidy* for transit agencies other than the VTA, including Caltrain, ACE, Capitol Corridor, BART, MUNI, and other
- *Monthly Vanpool Subsidy*
- *Commuter Tax Benefits* through WageWorks offering pre-tax deduction per month for transit and pre-tax deduction per month for parking
- *Free "Last Mile" Shuttles* to local train systems (e.g. Caltrain, Amtrak, ACE)
- *Free WiFi Commuter Buses* direct from areas like San Francisco and the TriValley area
- *Internal Carpool Matching Program* utilizing zip code matching
- *Regional Carpool Matching Program* through 511
- *Personalized Commute Assistance* offered by a Commute Coordinator
- *Preferred parking for Carpools and Vanpools* located near entrances to every building
- *Bicycle Lockers and/or Bicycle Racks* near entrances to every building
- *Showers* for cyclists and pedestrians, offering clean towel service, complimentary toiletries, hair dryers, and ironing boards
- *Intranet Site* featuring transit, bike, ridesharing and telework information
- *New Hire Orientation* presentations focusing on commute alternatives from Day 1
- *Centrally-Located Kiosks* with transit schedules, bike and transit maps, and other commute alternative information
- *Periodic Events* which connect employees with local transit agencies and transportation organizations (e.g. Spare the Air Fair, Bike to Work Day)
- *Onsite amenities* which allow employees to complete errands without a car, such as bicycle repair, dry cleaning, oil changes, carwash, haircuts, dental services, cafeteria, coffee bars, fitness center, massage services, mail and shipping services, convenience store, ATM, gift store.

**NCHRP 457 - Minor-road right-turn volume reduction for warrant check - Existing Plus Project PM at Lafayette Street and Great America Way**

INPUT

Number of lanes on major-road approach:		1	
Right-turn geometry on minor-road:		Right-turn bay provided	
Approach	Number	Movement	Volume
Major A	2	Through	556
	3	Right	19
Major B	5	Through	185
	6	Right	1
Minor C	7	Left	125
	8	Through	1
	9	Right	582
Minor D	10	Left	1
	11	Through	0
	12	Right	1

OUTPUT

Variable	Value
Conflicting major-road volume ( $V_{c9}$ ), veh/h:	566
Conflicting major-road volume ( $V_{c12}$ ), veh/h:	186
Right-turn volume reduction ( $V_{r9}$ ), veh/h:	335
Right-turn volume reduction ( $V_{r12}$ ), veh/h:	715
Adjusted right-turn volume reduction ( $V_{r9}$ ), veh/h:	335
Adjusted right-turn volume reduction ( $V_{r12}$ ), veh/h:	1
Adjusted minor-road volume, veh/h:	374
<b>Guidance:</b>	<b>Conduct warrant check again using adjusted minor road volume.</b>

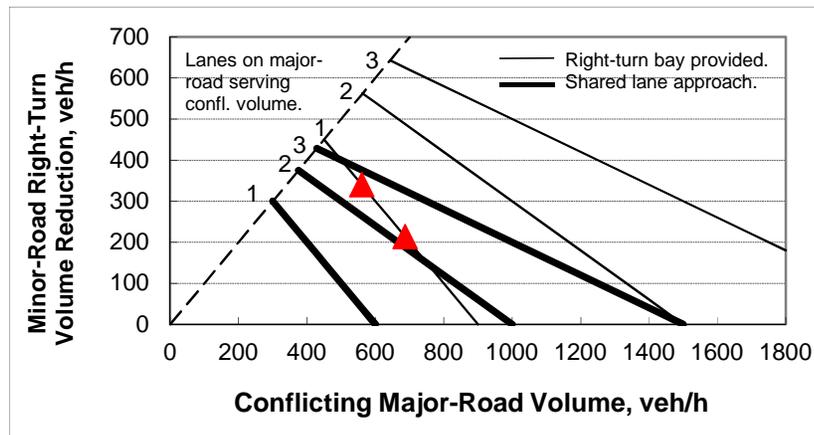

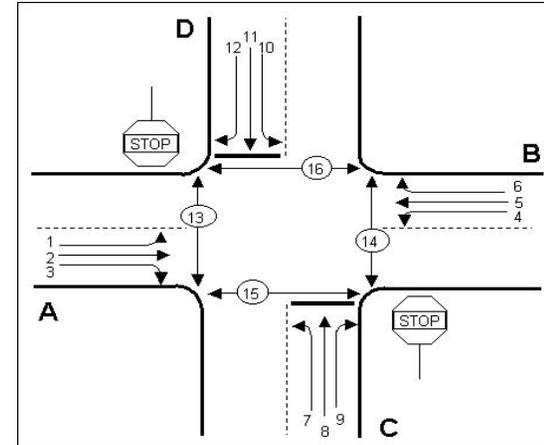

**NCHRP 457 - Minor-road right-turn volume reduction for warrant check - Background PM at Lafayette Street and Great America Way**

INPUT

Number of lanes on major-road approach:		1	
Right-turn geometry on minor-road:		Right-turn bay provided	
Approach	Number	Movement	Volume
Major A	2	Through	677
	3	Right	19
Major B	5	Through	560
	6	Right	1
Minor C	7	Left	125
	8	Through	26
	9	Right	582
Minor D	10	Left	1
	11	Through	130
	12	Right	211

OUTPUT

Variable	Value
Conflicting major-road volume ( $V_{c9}$ ), veh/h:	687
Conflicting major-road volume ( $V_{c12}$ ), veh/h:	561
Right-turn volume reduction ( $V_{r9}$ ), veh/h:	214
Right-turn volume reduction ( $V_{r12}$ ), veh/h:	340
Adjusted right-turn volume reduction ( $V_{r9}$ ), veh/h:	214
Adjusted right-turn volume reduction ( $V_{r12}$ ), veh/h:	211
Adjusted minor-road volume, veh/h:	520
<b>Guidance:</b>	<b>Conduct warrant check again using adjusted minor road volume.</b>

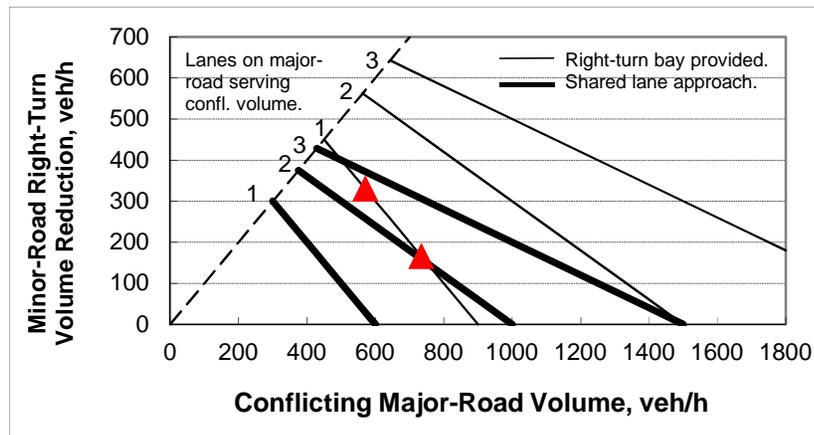

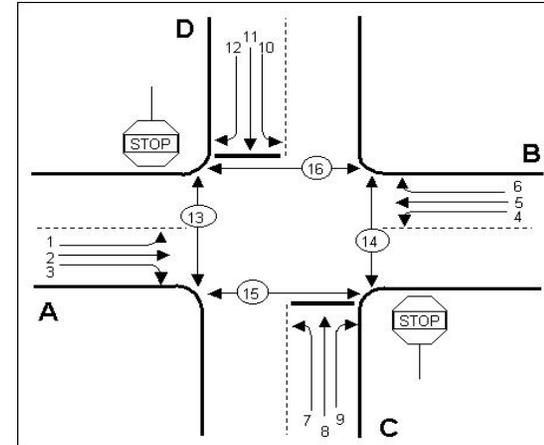

**NCHRP 457 - Minor-road right-turn volume reduction for warrant check - Background Plus Project PM at Lafayette Street and Great America Way**

INPUT
